Salesforce Release Notes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Spring '26 release helps companies to accelerate their journey to becoming an Agentic Enterprise by combining human expertise and AI agents – giving every team the insights, automation, and tools they need to deliver better customer experiences with confidence.

What's New This Release

- [Admin Release Countdown Blog](#). Important dates you'll want to mark on your calendar for Spring '26.
- [Spring '26 Pre-release Signup](#). Sign up for a pre-release org to get early access to the new features.

Release Readiness Essentials

- [Release Readiness Trailblazers](#). Access resources and experts for all things release readiness. To help us track and respond to your feedback, use a hashtag that indicates the release, such as #Spring26Feedback.
- [Trust Status Maintenance Site](#). See sandbox and other release dates and times. To see your maintenance dates, select Instances and your instance.
- [Sandbox Refresh Calculator](#), [Preview Video](#), and [Preview Instructions](#). Plan if and when to refresh your sandboxes. Learn how to navigate the sandbox preview process. Get early access to new features in your sandbox.
- [Certification Release Maintenance Schedule](#). Keep your certification updated in Trailhead.
- [Prepare for Salesforce Releases](#). Use Trailhead to create your release strategy.

Release Notes Tips

- Use the table of contents to browse through release notes by product. You can also search and filter to zero in on the news that matters the most.
- Your browser's settings determine the language that you see. To change the website language, scroll to the bottom of this page and use the language switcher in the website footer.
- [Salesforce Known Issues](#) are listed separately.

Note Until the new release is available to you, links from release notes to Salesforce Help, implementation guides, developer guides, and other documentation don't work. And sometimes the links point to material from the previous release. Some of our documentation has preview versions available several weeks before the release. To access a preview version on [Salesforce Developers](#), select **Preview** from the Documentation Version dropdown list.

Release Notes for Features Released Monthly

For some products, Salesforce releases features and enhancements more frequently than three times per year.

Release Note Changes

Read about what changes were made after the release notes were published. Changes are separated by product and with the most recent changes first. The dates indicate the week that changes to the release note were made. Review the individual release note availability details.

How and When Do Features Become Available?

Some features affect all users immediately after the release goes live. Consider communicating these changes to your users beforehand so that they're prepared. Other features require direct action by an administrator before users can benefit from the new functionality.

Salesforce Overall

Learn about new features and enhancements that affect your Salesforce experience overall.

Release Updates

Salesforce periodically provides release updates that improve the performance, logic, security, and usability of our products. The Release Updates page provides a list of updates that can be necessary for your organization to enable. Some release updates affect existing customizations.

Agentforce Platform

Supercharge your workforce efficiency with predictive and generative AI.

Analytics

Analytics enhancements include new and updated features for Tableau Next, Lightning reports and dashboards, Data 360 reports and dashboards, CRM Analytics, Intelligent apps, and Tableau.

Commerce

Commerce enhancements include features for B2B Commerce, Omnichannel Inventory, and Salesforce Order Management.

Customization

Complete Setup tasks more efficiently with the help of an AI assistant with Setup with Agentforce (beta). Import and export translation files more easily with enhancements to the Translation Workbench.

Development

Whether you're using Lightning components, Visualforce, Apex, or Salesforce APIs with your favorite programming language, these enhancements help you develop amazing applications, integrations, and packages for resale to other organizations.

Experience Cloud

Make your Aura and LWR site pages more discoverable to AI-powered search engines and improve the precision of AI-generated answers with generative engine optimization. Create richer HTML content for

Aura and LWR sites and enjoy greater design flexibility on LWR sites with expanded HTML allowlists and more readily available standard LWR components. Updates to Salesforce files make it easier for users to manage, delete, upload, and download files. The ability to create custom property types and editors for Aura and LWR sites is now generally available.

Field Service

See what's new in Agentforce Field Service, formerly Field Service, to help your team deliver on performance and customer service.

Hyperforce

Products and features from Data 360, Marketing Cloud, Platform, MuleSoft, and Tableau Cloud are now available in more Hyperforce regions. Hyperforce Assistant introduced a new way to find hard-coded references. The Hyperforce public IP ranges now include addresses for inbound connections, in addition to existing outbound addresses. Prepare for IPv6 if you use IP allowlists.

Industries

Learn about new features and enhancements across the Industries clouds.

Marketing

Personalize every moment of engagement across the customer lifecycle and drive growth for your business with the latest features and enhancements from Salesforce Marketing apps.

MuleSoft

Use the MuleSoft Anypoint Platform suite of products to connect and integrate apps, systems, and data across your enterprise. Streamline operations by building and automating processes with clicks instead of code. You can design, develop, govern, and share APIs and integration apps and host them in the cloud or on-premises.

Mobile

The Salesforce mobile app now uses single sign-on for faster logins and notifications that lets you work on tasks. Create mobile and offline ready Lightning Web components with Mobile MCP tools.

Omnistudio

Validate your workflows built with Omniscripts and Flexcards end-to-end by using the UI Test Automation Model (UTAM) framework. For a fast, scalable experience, add Omniscripts and Flexcards to Lightning Web Runtime (LWR) Experience Cloud sites (pilot). Get immediate help with an Omnistudio component or element with the Omnistudio Assistance AI Agent (pilot). With accessibility improvements for Omniscripts and Flexcards, create inclusive workflows and solutions for customers and users with disabilities. Filter empty records in Omnistudio Data Mapper Extract and Turbo Extract components with the Is Null operator.

Partner Cloud

Start managing the full partner lifecycle in one place with tools built directly into Salesforce. Use Partner Cloud to recruit, onboard, enable, and co-sell with partners while giving them secure access to the data and workflows they need. Bring together key capabilities like deal registration, incentives, training, and performance tracking so your team can scale indirect sales and improve partner relationships. Partner Cloud helps you do more with the partners you already have—faster, and with less manual work.

Revenue Management

Learn about new features and enhancements for Agentforce Revenue Management.

Sales

Learn about the latest features and updates to grow your pipeline and increase the efficiency of your sales teams. Sales Cloud is now Agentforce Sales. You may see references to Sales Cloud in our application and documentation.

[Salesforce CMS](#)

Previously known as Sidebar Extensions, Extensions in CMS have an improved development workflow. Build extensions to add more productivity tools to your CMS content workflow, such as third-party generative AI tools or tone and grammar editors. When you work with external content providers, you can now choose which providers are available to your workspace and where to save files from these systems.

[Salesforce Flow](#)

Compose intelligent workflows with Flow Builder and Flow Orchestration. Integrate across any system with Flow Integration.

[Salesforce for Slack Integrations](#)

Use Slack and Salesforce together to connect with customers, track progress, collaborate seamlessly, and deliver team success from anywhere.

[Security, Identity, and Privacy](#)

Redirections end for legacy host names, including instanced host names in API calls. Connected app creation is disabled by default for all Salesforce orgs. Salesforce Backup & Recover is now a native app. And, Privacy Requests fulfill your customers' Right to Be Forgotten requests.

[Service](#)

Service Cloud is now Agentforce Service. You may see references to Service Cloud in our application and documentation. Learn about the latest features from Service to supercharge productivity across your organization. Service features are released as often as monthly, so check here for the latest information.

[Other Salesforce Products and Services](#)

Get the latest information on these new features.

[Legal Documentation](#)

We made seasonal updates to Salesforce Legal Documents.

[Previous Release Notes](#)

Find information about previously announced features in the release note archive.

Commerce Components				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
New Commerce LWR Store Components		Yes		
Commerce Search				
Identify Products at Risk of Being Unsearchable		Yes		
Product Catalogs Include More Searchable and Filterable Fields				Yes
Commerce Subscriptions				
Sell Subscription Product Bundles in Your Commerce Store		Yes		
Enable Buyers to View Subscription History				Yes
Commerce Additional Features				
Sell Configurable Products in Your B2B Store		Yes		
Determine Product Visibility Dynamically by Using Qualification Rules		Yes		
Omnichannel Inventory				
Prevent Inventory Suppression with Safety Stock Caps		Yes		
Salesforce Order Management				
Agentforce for Salesforce Order Management				
Resolve Fulfillment Issues Proactively with Agentforce (Pilot)				Yes
Monitor AI-Generated Insights and Fulfillment Data in a Single Dashboard	Yes			
Control the Order of Payment Capture				Yes

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Manage Locations While Configuring Shipping Methods		Yes		

Customization

Complete Setup tasks more efficiently with the help of an AI assistant with Setup with Agentforce (beta). Import and export translation files more easily with enhancements to the Translation Workbench.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Setup with Agentforce				
Streamline Administrative Tasks with Setup with Agentforce (Beta)			Yes	
Globalization				
Export and Import Translated Files with Ease		Yes		
Speed Up Custom Label Updates in Translation Workbench		Yes		
Use Updated State Codes for Picklists		Yes		
Review Updated Label Translations		Yes		
Enable ICU Locale Formats (Release Update)		Yes		
List Views				
List View Edit Limits Are Communicated More Clearly		Yes		
Use Updated Empty Value Placement in List View Sorting	Yes			
AppExchange				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Configure New Trialforce Login Pages Before Summer '26		Yes		
General Setup				
Submit Records for Approval by Using the Request Approval Component			Yes	
Update Apex Code and Flows for Changed Sharing Recalculation Behavior (Release Update)			Yes	

Development

Whether you're using Lightning components, Visualforce, Apex, or Salesforce APIs with your favorite programming language, these enhancements help you develop amazing applications, integrations, and packages for resale to other organizations.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Lightning Components

Use Complex Template Expressions in Your Lightning Web Components (Beta)		Yes		
Display Consistent Empty State Illustrations With Theme Support (Beta)		Yes		
Get Complete Type Definitions for Lightning Base Components		Yes		
Improve Type Safety with the LWC TypeScript Converter MCP Tool (Beta)		Yes		
Update Your Custom Components for Use in Setup			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
with Agentforce (Beta)				
Check For Errors From the Disconnected DOM Node Rehydration Fix		Yes		
Manage Page Errors with Error Console			Yes	
Do More with Lightning Out 2.0 Improvements		Yes		
Lightning Design System				
Salesforce Lightning Design System Component Blueprints Updates	Yes			
Use Dark Mode in More Editions (Beta)	Yes			
Visualforce				
Escape the Label Attribute of <apex:inputField> Elements to Prevent Cross-Site Scripting in Visualforce Pages (Release Update)		Yes		
Apex				
Deploy Apex Components Faster by Running Only Relevant Tests (Beta)		Yes		
Use Apex Cursors for Expanded SOQL Query Result Support (Generally Available)		Yes		
Extract Picklist Values Based on Record Type		Yes		
Expose Apex REST and AuraEnabled Controller Methods as Agent Actions (Generally Available)		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Use Visualforce PDF Rendering Service with Apex Blob.toPdf() (Release Update)			Yes	
Review Apex Code for Changed Sharing Recalculation Behavior			Yes	
Filter Test Discovery API Results by Test Category		Yes		
Specify the Number of Async Jobs to Delete		Yes		
API				
Expose Custom SOQL in REST API Calls Using Named Query API (General Availability)			Yes	
Update Instanced URLs in API Traffic (Release Update)			Yes	
EventBusSubscriber Object's Position and Tip Fields Are Being Deprecated		Yes		
Sending Session IDs in Outbound Messages Is Being Removed		Yes		
Metadata Deployments and Retrievals Have New Limits		Yes		
Data 360 SOQL Query Results Are Limited to 12-MB at a Time		Yes		
SOAP API login() Call in SOAP API Versions 31.0 Through 64.0 Is Being Retired (Release Update)			Yes	
Packaging				
Recommend a Package Version to Your Subscribers		Yes		
Troubleshoot Subscriber Issues		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Faster by Enabling Debug Logs				
Development Environments				
Data Mask (Beta)				
Access Information About Specific Data Mask Job (Beta)		Yes		
Automate the Running of Data Mask Processes with Job Scheduler (Beta)		Yes		
Other Improvements to Salesforce Data Mask (Beta)		Yes		
Monitor Sandbox Copy Progress in Greater Detail with an Updated UI		Yes		
Platform Development Tools				
Agentforce DX				
Build Enterprise-Ready Agents with Agentforce DX and Agent Script (Beta)		Yes		
Salesforce DX MCP Server		Yes		
Salesforce CLI				
Keep Up with the Latest Salesforce CLI Enhancements		Yes		
Salesforce Extensions for Visual Studio Code		Yes		
Agentforce Vibes IDE		Yes		
Agentforce Vibes Extension		Yes		
Scalability				
Plan and Peak Load Test with Scale Test				Yes
Deploy Scalable Apps with Scale Center				Yes

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Optimize Pages with Lightning Experience Insights (Generally Available)			Yes	
Optimize Code with ApexGuru				Yes
Salesforce Functions				
Salesforce Functions Is Being Retired				Yes
Change Data Capture				
Change Data Capture Events No Longer Support Custom Formula Fields		Yes		
Platform Events				
The Timeout of Outbound Messages Is Reduced to 20 Seconds from 60 Seconds		Yes		
Identify Outbound Messages in Queue with a Renamed Heading		Yes		

Experience Cloud

Make your Aura and LWR site pages more discoverable to AI-powered search engines and improve the precision of AI-generated answers with generative engine optimization. Create richer HTML content for Aura and LWR sites and enjoy greater design flexibility on LWR sites with expanded HTML allowlists and more readily available standard LWR components. Updates to Salesforce files make it easier for users to manage, delete, upload, and download files. The ability to create custom property types and editors for Aura and LWR sites is now generally available.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Aura and LWR Sites				
Make Site Pages More Discoverable by AI		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Use Dynamic Redirect Rules in Aura Sites		Yes		
Return Users to Their Previous Page After Session Timeout		Yes		
Components in Experience Builder				
Design LWR Sites with More Standard Component Options	Yes			
Create Richer HTML Content with More Supported Tags and Attributes	Yes			
Guide and Inform Experience Cloud Users with Personalized Task and Activity Components			Yes	
Submit Records for Approval by Using the Request Approval Component			Yes	
Developer Productivity				
Create Custom Property Types and Editors for Lightning Web Components in Aura and LWR Sites (Generally Available)	Yes			
Connect API Performance Beta Setting Was Removed		Yes		
Site Performance				
Simplify Custom Domain Management with a Stable Target Host Name		Yes		
Visualforce Sites Display Only the Specified Favicon	Yes			
Salesforce Migrates Enhanced and Custom Domains Serving Digital Experiences to Cloudflare CDN		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Finish Updating Your Legacy Force.com Site URLs		Yes		
Salesforce Files				
Protect Your Salesforce Org and Users by Scanning Files for Malware (Beta)		Yes		
Manage Files up to 10 GB in Salesforce Files		Yes		
Allow More Users to Delete Files		Yes		
Other Changes				

Field Service

See what's new in Agentforce Field Service, formerly Field Service, to help your team deliver on performance and customer service.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Agentforce for Field Service				
Send Customers an Automated Email Confirming Their Scheduling Agent Request			Yes	
Streamline Pre-Work Brief with Rich Text	Yes			
Boost Pre-Work Brief Adoption with Enhanced User Experience	Yes			
Field Service Go				
Simplify Field Service Feature Discovery and Setup			Yes	
Field Service Scheduling and Optimization				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Enhanced Scheduling and Optimization				
Optimize Large Datasets in One Smooth Operation with Dynamic Scaling (Generally Available)			Yes	
Get More Optimal Scheduling with Updated Service Objective Scoring Formulas		Yes		
Access Optimization Request Files on Your Own (Generally Available)			Yes	
Get More Transparency into Service Operation Inefficiencies with Rule Violation Analytics (Beta)			Yes	
Experience Faster Dispatching with Enhanced Live Updates (Generally Available)			Yes	
Field Service Operations				
Drive Predictive Operations with Enhanced Scheduling and Optimization Insights (Beta)			Yes	
Field Service Customer Engagement				
Improve Sales Strategies with Visual Remote Assistant (VRA) Session Transcriptions			Yes	
Enable Private Mobile App Sharing in Visual Remote Assistant (VRA) Sessions			Yes	
Preview and Manage Images in the Visual Remote Assistant (VRA) Self-Service Request	Yes			
Validate Visual Remote	Yes			

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Assistant (VRA) Permissions and User Access Easily from the Configuration Panel				
Field Service Mobile				
Data Capture				
Accelerate Data Entry and Improve Form Accuracy with the Data Capture Lookup Component		Yes		
Enhance Productivity by Previewing Multiple Images in Data Capture Forms		Yes		
Boost Efficiency by Expanding Data Capture to Assets and Custom Objects		Yes		
Capture Data Even Faster with up to 80% Improvement in Form Loading Times		Yes		
Enhance Work Processes by Adding Data Capture Forms to Mobile Timesheets and Service Resources		Yes		
Automate Hands-Free Data Entry with Data Capture Voice to Form (Generally Available)			Yes	
Enhance the Field Service Mobile App with Native GIS Mapping			Yes	
Enhance the Mobile User Experience with a Configurable Feed			Yes	
Field Service Mobile App Support on Android 11 Is Deprecated		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Control Bulk Status Change Icon Visibility for Bundled Service Appointments			Yes	
Work More Efficiently with the Revamped Work Order Overview Page	Yes			
View Clear Information on Loading Stages During App Startup	Yes			
Optimize Your Mobile App Performance with Updated Technical Guidance		Yes		

Hyperforce

Products and features from Data 360, Marketing Cloud, Platform, MuleSoft, and Tableau Cloud are now available in more Hyperforce regions. Hyperforce Assistant introduced a new way to find hard-coded references. The Hyperforce public IP ranges now include addresses for inbound connections, in addition to existing outbound addresses. Prepare for IPv6 if you use IP allowlists.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Access Salesforce in More Regions with Hyperforce			Yes	
Find Hard-Coded References Using the Updated Hyperforce Assistant Process		Yes		
Hyperforce Public IP Ranges Now Include Inbound Addresses		Yes		
Prepare for IPv6 in Hyperforce Public IPs		Yes		

Industries

Learn about new features and enhancements across the Industries clouds.

Feature	Enabled for users	Enabled for administrators / developers	Requires administrator setup	Contact Salesforce to enable
Accounting Subledger				
Align Accounting Subledger with Your Institution's Data Strategy			Yes	
Asset Management				
Enhance Proactive Customer Service with Agentforce			Yes	
Inventory Management Enhancements				
Improve Order Fulfillment Accuracy with Inventory Allocation				
Streamline Inventory Counting Across Locations				
New and Changed Objects for Inventory Management			Yes	
Manage Asset Recall Inquiries Using Prebuilt Service Templates			Yes	
Access Claims from Product Service Campaign Items			Yes	
Timesheet and Labor Cost Optimization Enhancements				
Agentforce for Timesheets and Labor Cost Optimization				
Associate Assets and Equipment with Timesheets			Yes	
Capture Details with Configurable Forms			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Control Timesheet Entry Field Visibility			Yes	
Update Verified Timesheets			Yes	
Upsell and Cross-Sell Products for Service with Agentforce			Yes	
Automotive				
Agentforce for Automotive				
Boost Sales Productivity with Industries Sales Assistance	Yes			
Efficiently Manage Coverages for Proactive Customer Service	Yes			
Automotive Finance				
Defer a Customer's Payments in a Single Flow	Yes			
Optimizing Automotive Loan Funding with Funding Workbench	Yes			
Execute Post-Contract Review Tasks from Dealer Portals	Yes			
Streamline Recall Inquiries with a Prebuilt Service Process	Yes			
Access Automotive Claims from Product Service Campaign Items	Yes			
Accelerate Automotive Feature Discovery and Setup	Yes			
Associate Vehicles and Assets to Fleets Faster	Yes			
Enable Stage Management for Key Automotive Objects	Yes			
Expand Automotive Data Access and Mapping	Yes			

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
New and Changed Objects for Agentforce Automotive			Yes	
Channel Revenue Management				
Strengthen Partner Collaboration with Stock Rotation Incentives			Yes	
Manage Incentive Budgets to Drive Financial Accountability			Yes	
Enhance Financial Reporting with Subledger Integration			Yes	
Simplify Feature Discovery and Setup			Yes	
New and Changed Objects for Channel Revenue Management			Yes	
Communications				
Access More Industries Components in Agentforce Communications				
Enterprise Sales Management				
Associate Cloned Quotes with New or Existing Opportunities				
Retain Original Asset Pricing During Modifications				
Prevent Unnecessary Action Status Updates During MACD Operations				
Accelerate Sub-Order Creation with Scaled Batch Sizes				
Confirm Deletion of Quote Line Items in the Summary Tab				
View Placeholders for Hidden Attributes in Enterprise Sales Quotes				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Process Large Enterprise Quotes with Enhanced Stability				
Revenue Cloud for Communications on Salesforce Platform				
Communications Cloud Sales Is Now Revenue Cloud for Communications	Yes			
Simplify Revenue Cloud for Communications Feature Configuration and Setup			Yes	
Refine User Access with a New Permission Set			Yes	
Promotions in Revenue Cloud for Communications				
Consumer Goods				
Agentforce for Consumer Goods				
Boost Sales and Efficiency with AI-Driven Retail Execution Insights			Yes	
Get In-App Agent Assistance with Agentforce (Generally Available)			Yes	
Retail Execution				
Cancel Visits, Documents, and Orders on the Mobile App			Yes	
Experience Zero-Touch Voice-Activated Capabilities in Consumer Goods Cloud Mobile App			Yes	
Maintain Listing Classification Data Integrity	Yes			

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
New and Changed Objects for Retail Execution		Yes		
Sync Management				
Diagnose Sync Performance Easily with Named Query Analyzer	Yes			
Manage Orders and Cases Offline in Consumer Goods Cloud Mobile App	Yes			
Visual Studio Code Based Modeler				
Customize Page Dimensions and Styles in Print Layout	Yes			
Other Improvements in Visual Studio Code Based Modeler		Yes		
Trade Promotion Management				
Get Accrual Data Directly in Tactic Funds	Yes			
Get Accurate Financials for Tier Tactics and Growth Programs	Yes			
Integrate Trade Promotion Management Data with Data 360 for Enhanced Insights	Yes			
Customize the Trade Calendar and Account Plan Views with Smart UI Enhancements	Yes			
Choose Which Promotion Fields to Show in a Customer Business Plan	Yes			
New and Changed Objects in Trade Promotion Management	Yes			
Changed APIs in Trade Promotion Management		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Manage Consumer Goods Cloud Features in One Place		Yes		
Agentforce Energy & Utilities				
Upload Customer Site Data in Bulk			Yes	
Generate Quotes for Customers with Multiple Sites			Yes	
Create Multisite Quotes Quickly			Yes	
Manage Agentforce Energy & Utilities Features in One Place			Yes	
Financial Services Cloud				
Agentforce for Financial Services				
Banking Service Customer Assistance				
Financial Advisor Assistance Agent for FSC Managed Package				
Accelerate Setup with Salesforce Go		Yes		
Advanced Document Validation				
Simplify Validation for Document Checklists Items		Yes		
Flexible Hierarchies				
Map Complex Business Relationships to Assist in Decision-Making	Yes			
Complaint Management				
Speed Up Complaint Resolution		Yes		
Digital Lending				
Financial Intermediaries				
Service Process Automation				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Build Service Processes Faster with Prebuilt Templates in Unified Catalog		Yes		
Speed Up Resolutions for Service Processes with Agentic Self-Service			Yes	
Transaction Dispute Management				
Expand Your Dispute Intake to ACH Transactions	Yes			
Increase Dispute Intake Flexibility for Service Representatives	Yes			
Accelerate Mastercard Dispute Stage Setup with a Prebuilt Template			Yes	
Use More Agentforce Financial Services Objects with Data Cloud				
New Agentforce Financial Services Jumpstart Bundles			Yes	
New and Changed Agentforce Financial Services Objects			Yes	
New Connect REST API for Flexible Hierarchies				
Health				
Simplify Health Cloud Feature Discovery and Setup		Yes		
Agentforce for Health Cloud				
Access Member Plans and Eligibility Data by Using Agent Actions			Yes	
Document AI for Health				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
(formerly Intelligent Document Processing) Enhancements				
Add Agentforce to Payer Contact Center Quickly			Yes	
Manage Patient Updates Faster with Agentforce for Provider Contact Center			Yes	
Resolve Claims Queries Faster by Using Data 360 Zero-Copy Claims Actions			Yes	
Update athenahealth Patient Records Directly from Health Cloud			Yes	
Data Cloud for Health Cloud				
Easily Deploy Preconfigured Healthcare Solutions Using Data Kits	Yes			
Disease Surveillance Enhancements				
Analyze Disease Trends and Critical Cases with Analytics Dashboards		Yes		
Home Health Enhancements				
Simplify Coordination of Home Healthcare Across Patient Locations			Yes	
Personalize Home Healthcare by Using Custom Visit Instructions			Yes	
Enhance Health Outcomes with Offline Home Healthcare Assessments			Yes	
Calculate Budgets Precisely with Benefit Frequency			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Expedite Your Home Health Setup			Yes	
Integrated Care Management Enhancements

Evolve Flows Iteratively with Agentforce		Yes		
Simplify Your Flow Builder		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Layout by Collapsing Branching Elements				
Set Up the Agentforce Panel Without Admin Configuration		Yes		
View Subflow Input and Output Variable Descriptions More Easily		Yes		
View Action Input Descriptions More Easily		Yes		
Navigate Flow Builder Faster with Mouse Scrolling		Yes		
Decision Logic Labels Were Updated for Clarity		Yes		
Screen Flow Updates				
Tailor Screen Flows to Your Audience with Component-Level Styling Overrides	Yes			
Add Visually Distinct and Accessible Messages to Screen Flows	Yes			
Visualize and Track Record Progress with Kanban Boards in Screen Flows (Beta)		Yes		
Preview Files Natively in Screen Flows		Yes		
Find and Select Flow Resources More Easily in Screen Flows	Yes			
Open Screen Flows in Lightning Experience with a URL (Generally Available)	Yes			
Flow Marketing Cloud				
Automate Marketing Cloud Engagement Emails from Flow Builder	Yes			

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Ensure Recipients Don't Get Duplicate Messages	Yes			
Send Email Messages Using Activation Data	Yes			
Run Segment-Triggered Flows at The Right Time with More Scheduling Options	Yes			
Get More Targeted Segments in Segment-Triggered Flows	Yes			
Test Multiple Records in Segment-Triggered Flows in Debug	Yes			
Trigger Automation Event-Triggered Flows When CRM Records Change	Yes			
Stay Informed About Path Experiment Outcomes	Yes			
View Path Comparison Analytics in Path Experiment Element	Yes			
Control Path Selection When Debugging Path Experiments	Yes			
View Path Experiment History	Yes			
Trace Individual Paths Through Flows with View Record Run		Yes		
Personalize and Debug On-Demand Flows with Apex	Yes			
Remove Individuals from Flows Externally via API	Yes			
Flow Data 360				
Send Mass Notifications or Wait for Events with Asynchronous Broadcast Flows	Yes			
Use Decisions, Add Exit Rules,	Yes			

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
and More with Enhancements to Activation-Triggered Flows				
Use Flows with Data 360 Licenses and Increased Rate Limits	Yes			
Label for Custom Real-Time Data Graph Event Was Changed	Yes			
Flow Testing and Debugging				
Retain Debug Configurations Within Flow Editing Sessions		Yes		
Assign Flow Tests to Specific Flow Versions for More Control	Yes			
Flow Runtime				
Flow and Process Run-Time Changes in API Version 66.0		Yes		
Flow Management				
Monitor Flow Performance with View Flow Version Run Analytics		Yes		
Compare Screen Flow Versions to Track Changes More Efficiently	Yes			
View Flow Usage in the Automation Lightning App		Yes		
Monitor Performance for Active and Previously Run Flows on the Canvas		Yes		
Flow Extensions				
Navigate to Flows in Lightning Experience from Custom Lightning Components		Yes		
Flow and Process Release Updates				
Enforcing No-Argument			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Constructor on Apex Classes Used for Invocable Action Parameters (Release Update)				
Sort Apex Batch Action Results by Request Order (Release Update)			Yes	
Flow Approval Processes				
Add Approval Submissions to Record Pages Without Custom Buttons		Yes		
Complete Approval Work Items in Flow Builder While Debugging		Yes		
View Flow Approval Process Automation Usage in the Approvals Lightning App		Yes		
Debug Specific Segments of Flow Approval Processes		Yes		
Control Which Flow Approval Process Steps to Run in Debug Mode with Test Output		Yes		
Other Changes to Flow Approval Processes		Yes		
Flow Orchestration				
Create Orchestration from the Automation Lightning App		Yes		
Complete Orchestration Work Items in Flow Builder While Debugging		Yes		
View Orchestration Automation Usage in the Automation Lightning App		Yes		
Debug Specific Segments of Flow Orchestration		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Control Which Orchestration Steps to Run in Debug Mode with Test Output		Yes		
Other Changes to Flow Orchestration		Yes		
Automation Lightning App Updates				
See Where Actions Are Used in Agentforce Builder and Prompt Builder (Beta)	Yes			
Set Up and Monitor Flow Logging in One Place	Yes			
MuleSoft for Flow: Integration				
Enhance Data Exchange with a Newly Added Third-Party Connector	Yes			
MuleSoft for Flow: IDP		Yes		

Security, Identity, and Privacy

Redirections end for legacy host names, including instanced host names in API calls. Connected app creation is disabled by default for all Salesforce orgs. Salesforce Backup & Recover is now a native app. And, Privacy Requests fulfill your customers' Right to Be Forgotten requests.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Backup & Recover				
Protect and Recover Your Data with the Backup & Recover App			Yes	
Domains				
Update References to Legacy Host Names (Release Update)			Yes	
Replace Instanced URLs in API		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Traffic				
Switch to a Stable Target Host Name for Your Custom Domain		Yes		
A Warning Was Added for Potential Custom Domain Disruption		Yes		
Regional Edge Routing Label Was Changed		Yes		
Identity and Access Management				
Creation of New Connected Apps Is Disabled by Default		Yes		
Configure Canvas Plugin for External Client App		Yes		
Track Attempts to Use Uninstalled Connected Apps		Yes		
New and Updated Security Alerts for OAuth Flows		Yes		
API-Only Users Are Blocked from Bridging into UI Sessions				
Set Up Passwordless Login with Passkeys (Beta)			Yes	
Migrate SAML-Enabled Connected Apps to External Client Apps		Yes		
Migrate to a Multiple-Configuration SAML Framework (Release Update)		Yes		
Salesforce-Managed X (Formerly Twitter) Authentication Provider Retirement (Release Update)		Yes		
New LinkedIn Authentication		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Providers Use LinkedIn API v2				
Triple DES for SAML Single Sign-On Stops Working in Summer '26		Yes		
Sandbox Users with Non-Unique Usernames Can't Be Unfrozen		Yes		
Security Health Check				
New Configurable Settings Added to Health Check		Yes		
Stay Secure with Proactive Health Check Notifications		Yes		
Privacy Center				
Delete Records in Your Org and Data 360 with Privacy Requests	Yes			
Salesforce Shield				
Get Shield Setup Assistants and Usage Insights		Yes		
Simplify How Users Access the Shield App		Yes		
Event Monitoring				
Automatic Storage for Select Real-Time Events		Yes		
Delete Operation Tracking for ApiEvent		Yes		
Data Detect				
Increase Data Detect Scan Scope and Scale			Yes	
Scan for Custom Keywords with Data Detect			Yes	
Purchase a Standalone License for Data Detect			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Access and Run Data Detect Scans and Results with REST APIs			Yes	
Field Audit Trail				
Enhancements to Field History Tracking		Yes		
Increasing the Field Audit Trail Limit Beyond 60		Yes		
Shield Platform Encryption				
Encrypt Your Entire Database (GA Release)			Yes	
Bring Your Own Key to Data 360			Yes	
Security Center				
Monitor Login Anomaly Events Across Environments		Yes		
New Permission Metrics for Comprehensive Monitoring		Yes		
Set Alerts at the Child Tenant Level		Yes		
Other Changes				
Distinguish Between Blocked and Reported CSP Violations		Yes		
Salesforce Sites Display the Specified Favicon Only	Yes			

Service

Service Cloud is now Agentforce Service. You may see references to Service Cloud in our application and documentation. Learn about the latest features from Service to supercharge productivity across your organization. Service features are released as often as monthly, so check here for the latest information.

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
AI Agents for Service Cloud				
Agentforce Service Assistant				
Draft Service Plans in Service Rep's Preferred Language			Yes	
Use Case Feed as the Latest Grounding Source to Strengthen Service Plans	Yes			
Add More Context to Service Plans with Messaging Session and Voice Call Record Grounding				
Draft Comprehensive Service Plans with Expanded Data Access			Yes	
Agentforce Employee Agent				
Boost SLA Compliance by Using Agentforce SLA Summary	Yes			
Case Management				
Gain Instant Case Context with Case Timeline	Yes			
Use Quick Text in Case Comments	Yes			
Easily View Original Case Attachments	Yes			
Enhance Your Security of Organization-Wide Email Addresses			Yes	
Channels				
Email				
Email Across Languages with Real-Time Translations			Yes	
Agent Session Continuity is Improved for Case-Related Email			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Threads				
Inbound Limit for Service Agent Emails is Extended			Yes	
Email Composer is Modernized with New Button Colors			Yes	
Messaging				
Accept Clearer Terms and Conditions in Enhanced Chat		Yes		
Save Money by Hiding the Real-Time Translations Preview Bar			Yes	
Protect Service Reps' Privacy in Business-Initiated Outbound Messaging			Yes	
Educate Service Reps About Chat Exit Behavior			Yes	
Take Ownership of your Data Residency on Unified WhatsApp			Yes	
Increase Familiarity and Rapport in WhatsApp with Read Receipts and Typing Indicators			Yes	
Review De-Duplication Activity for Unified WhatsApp			Yes	
Bring Your Own Channel				
Voice				
Scale Your VoiceCall Object with More Custom Fields		Yes		
Manage Contact Center Groups and Queues in Bulk		Yes		
Add Flexibility to Unified Routing Transfers by Routing Calls to a Flow			Yes	
Route Voicemails and Desk	Yes			

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Phone Calls with Unified Routing				
Minimize Abandoned Calls with Queued Callbacks for Omni-Channel Unified Routing			Yes	
Use Voicemail Drop for Outbound Calls (Beta)			Yes	
Link Voice Calls to Their Source Records Automatically	Yes			
Get Actionable Error Messages for Failed Outbound Calls	Yes			
Get the Latest Enhancements for Your Amazon Connect Contact Center		Yes		
Update Your United States AWS Billing Address for Accurate Emergency Calling Fees	Yes			
Chat				
Legacy Chat Is Being Retired	Yes			
Customer Signals Intelligence				
Activate Customer Insights Faster			Yes	
Uncover Real-Time Insights During Customer Interactions			Yes	
Customize Out-of-the-Box AI Insights Prompts			Yes	
Process Large Data Volumes	Yes			
Einstein for Service				
Get Role-Based Case Overviews with Enhanced Summaries			Yes	
Work Summaries for Case (Beta) Is Being Retired			Yes	
Track AI Performance with			Yes	

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Service AI Adoption & Analytics				
Einstein Service Replies				
Decrease Response Time for Global Service Representatives with Translate Service Replies			Yes	
Entitlements and Milestones				
Improve SLA Reporting by Using Rule-based Milestone Pause	Yes			
Keep Departments Aligned on SLA Commitments with Bidirectional Milestone Visibility	Yes			
Optimize SLA Compliance by Using Agentforce SLA Summary	Yes			
Feedback Management				
Enhance Survey Readability with Revamped Matrix Questions View	Yes			
Save Partial Survey Responses for up to 999 days	Yes			
Save Partial Survey Responses from Guest Users	Yes			
Customize Your Surveys with Custom CSS	Yes			
HR Service				
Improve Employee Experience with New Unified Employee License for HR Service	Yes			
Strengthen Employee Trust with Confidential Case Reporting	Yes			
Knowledge				

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Organize Articles and Improve Navigation with Knowledge Maps (Generally Available)			Yes	
Get More Done in the Lightning Article Editor	Yes			
Unified Knowledge Is Being Retired			Yes	
Identify and Address Gaps in Your Knowledge Base with Self Learning Knowledge (Generally Available)			Yes	
Self-Service				
Build Proactive Service Scenarios with the New Detection and Segmentation UI		Yes		
Guide Your Users Through Interactive Troubleshooting for Proactive Scenarios		Yes		
Give Your Users Personalized Self-Service with a Unified Customer Profile		Yes		
Help Experience Cloud Site Users Track Their History with a Personalized Activity Timeline		Yes		
Guide Experience Cloud Site Users with a Proactive Pending Task Banner		Yes		
Bill AI Self-Service Usage More Accurately with Session-Based Tracking		Yes		
Improve Dynamic Q&A Performance with Persisted Questions and Answers for Authenticated Users		Yes		

Feature	Enabled for users	Enabled for administrators /developers	Requires administrator setup	Contact Salesforce to enable
Monitor Proactive Service Campaign Performance			Yes	
Service Adoption				
Service Setup and Service Setup Assistant Retiring in New Orgs	Yes			
Routing				
Monitor Your Hybrid Service Team with Command Center for Service	Yes			
Route Voice Conversations to External Bots	Yes			

Salesforce Overall

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about new features and enhancements that affect your Salesforce experience overall.

General Enhancements

Spring '26 gives you more reasons to love Lightning Experience.

Salesforce Foundations

Use the new Email Builder Lite to quickly create and send batch emails to your Sales contacts and leads. Tableau dashboards have been added to the Marketing App.

Salesforce Data Pipelines

Securely access your Amazon Redshift data by using a virtual private connection. Take advantage of OAuth functionality in your Microsoft Azure SQL Database connection.

Trust Site Enhancements

The Trust site is the single place to see the status of Salesforce services and products, upcoming availability impacting activities, and availability-related communications.

General Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Spring '26 gives you more reasons to love Lightning Experience.

Prepare for Shorter Certificate Lifespans

If you use features that rely on certificates, prepare to update the related certificates more frequently. An upcoming industry-wide change decreases the maximum allowed Transport Layer Security (TLS) certificate lifespan over the next 3 years. Also, Salesforce plans to stop public certificate rotation announcements.

Get Ready for IPv6

To help mitigate the IP address scarcity of IPv4, Salesforce is working behind the scenes to support IPv6. If you use an IP allowlist to restrict network traffic or you restrict access to Salesforce via IP address, consider implementing a preferred alternative. Otherwise, prepare to update your allowlists to include IPv6 addresses.

Elevate Your Salesforce Go Experience with Smarter Filters and Enhanced Search

Tailor your Salesforce Go home page to focus on the features that matter most to you by rearranging or removing specific sections. When you filter your view by cloud, add a subvertical filter to see which feature sets and features apply to specific verticals within the cloud. Also, use enhanced search to spot the differences between features and feature sets with the same names.

Capture Employee Details for Unified Employee License Holders

Designate employees who have the Unified Employee license as employee users and capture more details for your reports, such as employee status and number.

Styling Change to Highlighted and Selected Content

To meet the Web Content Accessibility Guideline (WCAG) 1.4.11 standard for non-text accessibility, we changed the styling of highlighted and selected content throughout the Lightning UI. Previously, we applied our own styling to show when content was highlighted or selected, but have determined that the styling didn't meet this WCAG standard. Now when you highlight or select content, the Lightning UI uses the styling applied by the user agent, which is your browser or device. The user agent determines the color contrast ratio.

Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% (Release Update)

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of page headers and modal windows when viewed at high magnification. This is the beginning of our effort to comply with WCAG 2.2 Resize and Reflow guidelines. Expect accessibility enhancements to other UI elements in future release updates.

Enable Accessibility Enhancements for Cards, Docked Containers, Menu Lists, and Panels (Release

Update)

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of cards, docked containers, menu lists, and panels when viewed at high magnification. This release update is dependent on the Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% release update. Make sure to enable that update first.

Enable Accessibility Enhancements for Date Pickers, Popovers, Bottom Utility Bars, Record Headers (Release Update)

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of date pickers, popovers, bottom utility bars, and record headers when viewed at high magnification. This release update is dependent on the Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% release update. Make sure to enable that update first.

Prepare for Shorter Certificate Lifespans

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

If you use features that rely on certificates, prepare to update the related certificates more frequently. An upcoming industry-wide change decreases the maximum allowed Transport Layer Security (TLS) certificate lifespan over the next 3 years. Also, Salesforce plans to stop public certificate rotation announcements.

Where: This change applies to Lightning Experience, Salesforce Classic, and the Salesforce mobile app in all editions. As we reach each milestone, the lifespans apply to all new certificates that a public Certificate Authority (CA) signs, regardless of whether you, Salesforce, or a third party purchases the certificate. Existing certificates keep their expiration dates, and self-signed certificates aren't subject to the new lifespans.

When: In August 2025, the Certification Authority Browser Forum (CA/Browser Forum) [announced](#) a phased approach to shorten the lifespan for new TLS certificates. That lifespan decreases from 398 days to 200 days on March 15, 2026, to 100 days on March 15, 2027, and to 47 days on March 15, 2029.

As certificates rotate more frequently, Salesforce plans to stop the existing announcements for certificate changes for first-party (1P) production orgs through the [Certificate Changes Trailblazer Community group](#). There's no specific target date for the end of those announcements. Salesforce plans to announce that date at least 90 days in advance.

Why: Salesforce complies with the guidance of the CA/Browser Forum, the organization that sets most Web Public Key Infrastructure (WebPKI) rules. Their TLS Server Baseline Requirements change regularly.

Those requirements are outside of Salesforce control, and certificate vendors are bound by the same rules.

How: Review your certificate use and plan to rotate the certificates that you own more frequently and stop using certificate pinning.

To receive notifications about upcoming certificate expirations for certificates that are stored in your org, assign the Expired Certificate Notification permission to specific admins. To automate the creation and update of self-signed and Certificate Authority-signed certificates in Salesforce, use the Certificate Metadata API type.

Get Ready for IPv6

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To help mitigate the IP address scarcity of IPv4, Salesforce is working behind the scenes to support IPv6. If you use an IP allowlist to restrict network traffic or you restrict access to Salesforce via IP address, consider implementing a preferred alternative. Otherwise, prepare to update your allowlists to include IPv6 addresses.

Where: This change applies to Lightning Experience and Salesforce Classic in all editions.

When: Today, IPv6 is supported only for the Salesforce Content Delivery Network (CDN) for Experience Cloud sites. With full IPv6 support, users and integrations can connect to Salesforce via an IPv6 address. We're announcing this upcoming change to give you time to update your allowlists.

There's no specific target date for full IPv6 support. Salesforce plans to roll out IPv6 support in stages, starting with Salesforce Government Cloud orgs. Salesforce plans to provide the IPv6 addresses to allow for Government Cloud orgs by December 31, 2025. Government Cloud customers, check the [IP Addresses to Allow for Government Cloud Plus](#) Knowledge Article for that information in early 2026.

Check future release notes for the specific timing for each stage. For other stages, Salesforce plans to provide the IPv6 addresses to allow at least 2 months before IPv6 is fully supported in the affected orgs.

Why: IP address restrictions can exist both in and outside Salesforce.

In Salesforce, an IP address allowlist range can include either IPv4 or IPv6 addresses but not both types. When Salesforce supports IPv6 for your org, IPv4 allowlists remain active, and users can only log in via an IPv6 address that their profile allows. To make sure that your users can continue to access Salesforce after this change, for each profile with a login IP range, add one or more login IP ranges with those users' IPv6 addresses.

Outside Salesforce, your company can restrict network traffic. An example is an allowlist that determines which IP addresses your users can access or which IP addresses can access your network. If those allowlists don't include Salesforce IPv6 addresses when Salesforce supports IPv6, users can experience disruption, and integrations can fail.

How: If you use IP allowlists, consider a [preferred alternative](#), such as domain allowlists or Service Name Indication (SNI).

If you continue to restrict access to Salesforce by IP address, update your allowlists in Salesforce. There's no correlation between an IPv6 address and an IPv4 address. To determine your users' IPv6 addresses, work with your network team.

If you continue to restrict network traffic via IP address, plan to update those allowlists to include Salesforce IPv6 addresses when those addresses are available.

Elevate Your Salesforce Go Experience with Smarter Filters and Enhanced Search

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

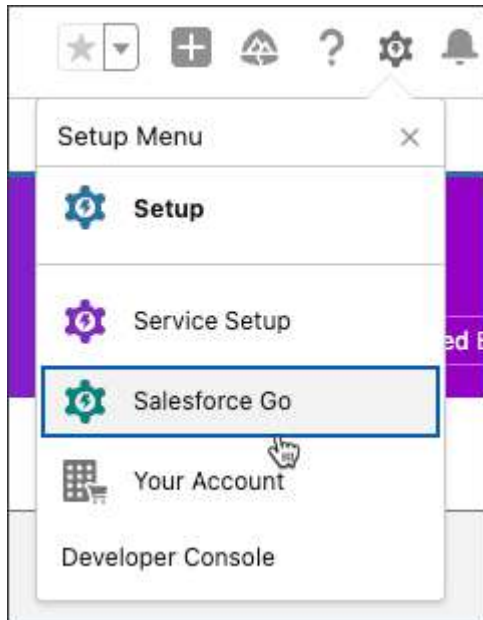

Tailor your Salesforce Go home page to focus on the features that matter most to you by rearranging or removing specific sections. When you filter your view by cloud, add a subvertical filter to see which feature sets and features apply to specific verticals within the cloud. Also, use enhanced search to spot the differences between features and feature sets with the same names.

Where: This change applies to Lightning Experience in Pro Suite, Professional, Enterprise, Performance, Unlimited, and Developer editions, and in Agentforce 1 Sales Edition.

Who: To view Salesforce Go, you must have the View Setup and Configuration user permission. To turn

on features in Salesforce Go, you must have the Customize Application user permission.

How: From the gear menu, select **Salesforce Go**.

Customize your home page by moving or removing sections. Use the cloud and subvertical filters to view related feature sets and features.

[Salesforce Help: Discover and Set Up Features with Salesforce Go](#) (can be outdated or unavailable during release preview)

Capture Employee Details for Unified Employee License Holders

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Designate employees who have the Unified Employee license as employee users and capture more details for your reports, such as employee status and number.

Where: This change applies to Enterprise, Performance, and Unlimited editions.

How: To designate a user as an employee user, first create a Person Account for this user and associate the account to the user's Employee2 record. Then, on the person's User page, click **Enable Employee User** and fill out the necessary details.

After you designate someone as an employee user, the button changes to **View Employee User**, and you can view the user's Employee2 record page.

Styling Change to Highlighted and Selected Content

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To meet the Web Content Accessibility Guideline (WCAG) 1.4.11 standard for non-text accessibility, we changed the styling of highlighted and selected content throughout the Lightning UI. Previously, we applied our own styling to show when content was highlighted or selected, but have determined that the styling didn't meet this WCAG standard. Now when you highlight or select content, the Lightning UI uses the styling applied by the user agent, which is your browser or device. The user agent determines the color contrast ratio.

Where: This change applies to Lightning Experience.

Why: Meeting accessibility standards helps your UI support all of your users.

Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of page headers and modal windows when viewed at high

magnification. This is the beginning of our effort to comply with WCAG 2.2 Resize and Reflow guidelines. Expect accessibility enhancements to other UI elements in future release updates.

Where: This change applies to Lightning Experience in all editions.

When: Salesforce enforces this update in Summer '26. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the **Maintenance** tab.

Why: With this update, content is visible for users who view Salesforce via a browser at 200% magnification or greater.

Without this update, you can have trouble seeing the content on a page when you zoom in over 200%. The page headers can block content as you scroll. In modal windows, buttons and other content can display outside the viewport, requiring horizontal scrolling, which can make modal windows unusable.

These changes help you support users who want to zoom 300% to 400%. The page header scrolls with the page and doesn't block the content. In modal windows, buttons and content display within the viewport and the window is fully functional.

How: To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200%, follow the testing and activation steps.

Enable Accessibility Enhancements for Cards, Docked Containers, Menu Lists, and Panels (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of cards, docked containers, menu lists, and panels when viewed at high magnification. This release update is dependent on the Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% release update. Make sure to enable that update first.

Where: This change applies to Lightning Experience in all editions.

When: Salesforce enforces this update in Winter '27. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the **Maintenance** tab.

Why: With this update, content displays correctly in cards, docked containers, menu lists, and panels for users who view Salesforce via a browser at 200% magnification or greater.

Without this update, these parts of the Salesforce UI aren't compliant with WCAG 2.2 guidelines for Resize and Reflow. Content potentially displays only partially.

These changes help you support users with visual impairments.

- Cards, docked containers, menu lists, and panels are accessible and usable at 1280px page width and 400% magnification.
- The header content in these UI elements isn't clipped. Instead, it wraps to the next line.

How: To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Enable Accessibility Enhancements for Cards, Docked Containers, Menu Lists, and Panels, follow the testing and activation steps.

Enable Accessibility Enhancements for Date Pickers, Popovers, Bottom Utility Bars, Record Headers (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of date pickers, popovers, bottom utility bars, and record headers when viewed at high magnification. This release update is dependent on the Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% release update. Make sure to enable that update first.

Where: This change applies to Lightning Experience in all editions.

When: Salesforce enforces this update in Summer '26. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the **Maintenance** tab.

Why: With this update, content displays correctly in date pickers, popovers, bottom utility bars, and record headers for users who view Salesforce via a browser at 200% magnification or greater.

Without this update, these parts of the Salesforce UI aren't compliant with WCAG 2.2 guidelines for Resize and Reflow. Content potentially displays only partially.

These changes help you support users with visual impairments.

- Date pickers, popovers, and page headers are accessible and usable at 1280px page width and 400% magnification.
- Bottom utility bars truncate button labels to fit within the height of the utility bar.
- The full text of a truncated button label appears in a tooltip if you hover a mouse over a button or

place keyboard focus on it.

How: To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Enable Accessibility Enhancements for Date Pickers, Popovers, Bottom Utility Bars, Record Headers, follow the testing and activation steps.

Salesforce Foundations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the new Email Builder Lite to quickly create and send batch emails to your Sales contacts and leads. Tableau dashboards have been added to the Marketing App.

[Automate Your Outreach with a Lighter, Faster Email Builder App](#)

Now it's easier than ever to connect with your customers. The new Email Builder Lite lets you quickly create and send batch emails to your Sales contacts and leads. Choose from a library of ready-made layouts, or build your own with our new component-based authoring experience. All emails you create are automatically saved to your CMS Content Workspace for easy access and reuse. It's all accessible right from your Sales list views, so you can automate your outreach via an intuitive interface, without having to open another tab.

[Gain Deeper, More Intuitive Insights from Your Marketing Data with Tableau in the Marketing App](#)

The marketing dashboards in Salesforce Foundations have just gotten an upgrade, courtesy of Tableau! Once configured, you'll find these new visualizations under the Performance Tab, helping you see what's working and optimize your marketing strategy faster than ever.

Make your purchase decisions only on the basis of generally available products and features.

Now it's easier than ever to connect with your customers. The new Email Builder Lite lets you quickly create and send batch emails to your Sales contacts and leads. Choose from a library of ready-made layouts, or build your own with our new component-based authoring experience. All emails you create are automatically saved to your CMS Content Workspace for easy access and reuse. It's all accessible right

from your Sales list views, so you can automate your outreach via an intuitive interface, without having to open another tab.

Where: This change applies to [supported editions for Salesforce Foundations](#).

How: To be accessible, Email Builder Lite requires admin enablement. From Setup, in the Quick Find box, enter and select Salesforce Foundations. Under Foundations Apps and Features, enable Email Builder Lite for Sales.

Gain Deeper, More Intuitive Insights from Your Marketing Data with Tableau in the Marketing App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The marketing dashboards in Salesforce Foundations have just gotten an upgrade, courtesy of Tableau! Once configured, you'll find these new visualizations under the Performance Tab, helping you see what's working and optimize your marketing strategy faster than ever.

Where: This change applies to [supported editions for Salesforce Foundations](#).

When: This feature became available for implementation starting in early December.

How: To unlock these new dashboards, activate Marketing Performance from the Foundations setup page. For any of our new users: this is a required setup step to use marketing features. For all our existing users: go to the Foundations setup page and activate Marketing Performance to see the new dashboards. Legacy dashboards will remain active until you do.

Salesforce Data Pipelines

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Securely access your Amazon Redshift data by using a virtual private connection. Take advantage of OAuth functionality in your Microsoft Azure SQL Database connection.

Securely Connect Your Private Redshift Data to CRM Analytics

Integrate data from your private Amazon Redshift data warehouse into Salesforce Data Pipelines. Use a virtual private connection (VPC) to make sure that all data transfer happens over an internal network, bypassing the public internet for enhanced security and compliance.

Use OAuth Security with Your Microsoft Azure SQL Database Connection

Increase data security by connecting to Microsoft Azure SQL Database using OAuth 2.0 authentication. You can now provide Azure authentication values directly, eliminating the need for a separate external authentication provider setup.

Improve Snapshot Data Recipe Performance with Optimized Upsert and Delete Actions (Generally Available)

Decrease processing time with quicker data recipe runs. Instead of processing all rows in the snapshot data, the optimized upsert and delete actions run incrementally on subsets of the snapshot data, resulting in faster runs. This feature is now generally available.

Securely Connect Your Private Redshift Data to CRM Analytics

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Integrate data from your private Amazon Redshift data warehouse into Salesforce Data Pipelines. Use a virtual private connection (VPC) to make sure that all data transfer happens over an internal network, bypassing the public internet for enhanced security and compliance.

Where: This change applies to Salesforce Data Pipelines in Lightning Experience and Salesforce Classic. Salesforce Data Pipelines is available for an extra cost in Enterprise, Performance, and Unlimited editions. Salesforce Private Connect is required.

How: From Setup, in the Quick Find box, enter *Private*, and select **Private Connect**. Create an outbound connection, and then on the Named Credentials page, create external and named credentials. In Data Manager, on the Private tab, create a connection for the Redshift Private Connector.

Trust Site Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Trust site is the single place to see the status of Salesforce services and products, upcoming availability impacting activities, and availability-related communications.

Personalized Trust Is Now Salesforce My Trust Center (Beta)

Salesforce My Trust Center (beta) provides authenticated access to service health information tailored to your specific Salesforce products and services. Based on customer feedback, the renamed Salesforce My Trust Center (beta) has been improved. Subscribe to notifications, access 1 year of extended incident and maintenance history with enhanced navigation, and view details on org location and MyDomain information. Also, the public Status site now supports Heroku and Spiff.

Personalized Trust Is Now Salesforce My Trust Center (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce My Trust Center (beta) provides authenticated access to service health information tailored to your specific Salesforce products and services. Based on customer feedback, the renamed Salesforce My Trust Center (beta) has been improved. Subscribe to notifications, access 1 year of extended incident and maintenance history with enhanced navigation, and view details on org location and MyDomain information. Also, the public Status site now supports Heroku and Spiff.

Where: These changes apply to my.trust.salesforce.com and [Status.salesforce.com](https://status.salesforce.com).

Note Salesforce My Trust Center (beta) is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](https://www.salesforce.com/agreements) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Why: New capabilities in Salesforce My Trust Center (beta) include:

- **Subscriptions:** Subscribe to notifications for events on your tenants through a new tab.

- **Extended history:** View 1 year of incident and maintenance history, plus the next 90 days of upcoming maintenance. Navigate all data with search, filtering, and pagination tools.
- **Enhanced tenant details:** See org location and MyDomain information for Sales, Service, and Industries on tenant detail pages.
- **Accessibility:** Complies with WCAG 2.2 standards.
- **Documentation:** Access Salesforce My Trust Center (beta) documentation on the Help site.

The public Status site now supports [Heroku](#) and [Spiff](#).

How: To access Salesforce My Trust Center (beta), go to [Trust.salesforce.com](#), click **Log In**, and then click **Log in to Trust**. Or go to [Status.salesforce.com](#), click **Learn More**, and then log in with your [Trailblazer account credentials](#).

We value your feedback. Share your thoughts by using this [feedback form](#) or by reaching out to your account team.

Release Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce periodically provides release updates that improve the performance, logic, security, and usability of our products. The Release Updates page provides a list of updates that can be necessary for your organization to enable. Some release updates affect existing customizations.

Every time a release update is created, it gets scheduled to be enforced in a future release. We announce each update and its schedule here as soon as that schedule is known, but occasionally, updates are postponed or canceled. If that happens, we let you know in the section that describes that specific release update.

Often, release updates provide a Test Run option so you can enable an update and examine any changes to your org, including changes to customizations, before that update's Complete Steps By date. You can view attachments in the Salesforce mobile app, but you can't edit them.

To view release updates, from Setup, in the Quick Find box, enter *Release Updates*, and select **Release Updates**.

Enforced with This Release

These updates are scheduled to be enforced this release.

Escape the Label Attribute of <apex:inputField> Elements to Prevent Cross-Site Scripting in Visualforce Pages (Release Update)

To prevent malicious code from executing in cross-site scripting (XSS) attacks on your Visualforce pages, this release update escapes the label attribute of your `<apex:inputField>` tags. First available in Spring '23, this update is enforced in Spring '26.

Update References to Legacy Host Names (Release Update)

Prevent disruption for your customers and end users when the temporary redirection of legacy (non-enhanced) Salesforce host names ends. With this release update, those redirections end in all orgs. First available in Spring '25, this update is enforced in Spring '26.

Scheduled to Be Enforced in Summer '26

These updates are scheduled to be enforced in Summer '26. The list can include new, previously announced, and previously postponed release updates.

Enable Accessibility Enhancements for Date Pickers, Popovers, Bottom Utility Bars, Record Headers (Release Update)

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of date pickers, popovers, bottom utility bars, and record headers when viewed at high magnification. This release update is dependent on the Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% release update.

Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% (Release Update)

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of page headers and modal windows when viewed at high magnification. This is the beginning of our effort to comply with WCAG 2.2 Resize and Reflow guidelines.

Migrate to a Multiple-Configuration SAML Framework (Release Update)

If you see this release update, your Salesforce instance is using our original single-configuration SAML framework, which supports single sign-on (SSO) with only one identity provider. We're giving you a final reminder that with the Summer '26 release, we're no longer supporting the single-configuration SAML framework. To make sure that your SSO configurations don't break, migrate to our newer multiple-configuration SAML framework, which supports SSO with multiple identity providers instead of just one. If you don't migrate, your SAML single sign-on configurations will stop working when this release update is enforced in Summer '26.

Salesforce-Managed X (Formerly Twitter) Authentication Provider Retirement (Release Update)

The Salesforce-managed app for the X (formerly Twitter) authentication provider is being retired. This update breaks any single sign-on (SSO) configurations that use the Salesforce-managed X

app. To avoid disruptions, create a custom X app and update your SSO configurations.

Update Instanced URLs in API Traffic (Release Update)

To prevent disruption when Salesforce ends support for API traffic that uses an incorrect instanced URL, make sure that API traffic to your org uses the org's My Domain login URL. First available in Summer '25, this release update was scheduled to be enforced in Spring '26, but we postponed the enforcement to Summer '26.

Use Visualforce PDF Rendering Service with Apex Blob.toPdf() (Release Update)

With this update enabled, the Apex `Blob.toPdf()` method for PDF rendering uses the same rendering service as Visualforce. The Visualforce PDF rendering service offers improvements such as additional fonts and multibyte character support. This change makes PDF rendering more consistent on the Salesforce Platform.

Scheduled to Be Enforced in Winter '27

These updates are scheduled to be enforced in Winter '27. The list can include new, previously announced, and previously postponed release updates.

Adopt Authorized Email Domains (Release Update)

If you previously worked with Salesforce Customer Support to disable email change verifications, set up authorized email domains instead. Salesforce is retiring the existing exemption process for disabling this feature, and authorized email domains provide the same benefit.

Enable Accessibility Enhancements for Cards, Docked Containers, Menu Lists, and Panels (Release Update)

To help meet Web Content Accessibility Guidelines (WCAG) 2.2 for Resize and Reflow, enable Lightning Experience to adapt the behavior of cards, docked containers, menu lists, and panels when viewed at high magnification. This release update is dependent on the Enable Accessibility Enhancements for Page Headers and Modal Windows When Zoom Is Greater Than 200% release update.

Scheduled to Be Enforced in Spring '27

These updates are scheduled to be enforced in Spring '27. The list can include new, previously announced, and previously postponed release updates.

Salesforce to Salesforce Is Being Retired (Release Update)

Salesforce to Salesforce is being retired in Spring '27. Salesforce has more powerful and integrated solutions that align with modern business needs. To prevent disruption when Salesforce ends support for the Salesforce to Salesforce product, make sure that you migrate your integrations to one of these recommended solutions: Partner Cloud, Data Cloud One, MuleSoft Anypoint, or MuleSoft for Flow.

Update Apex Code and Flows for Changed Sharing Recalculation Behavior (Release Update)

To optimize performance after large-scale updates to groups or roles, Salesforce now performs some sharing recalculations asynchronously. If Apex code and flows require that share records be updated immediately, the code and flows can break when this release update is enforced.

Update Apex classes, tests, and flows that update group membership or roles if they rely on synchronous sharing recalculation. This update is available starting in Spring '26.

Scheduled to Be Enforced in Summer '27

These updates are scheduled to be enforced in Summer '27. The list can include new, previously announced, and previously postponed release updates.

SOAP API login() Call in SOAP API Versions 31.0 Through 64.0 Is Being Retired (Release Update)

In Summer '27, the SOAP API login() call in SOAP API versions 31.0 through 64.0 will no longer be supported and no longer be available.

Agentforce Platform

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Supercharge your workforce efficiency with predictive and generative AI.

Bring the power of assistive and autonomous AI to your business with Agentforce.

[Migrate Your Agents' Connected Apps to the External Client App Framework](#)

With the Spring '26 release, you can no longer create connected apps. For the best customer

experience, migrate your connected apps to external client apps. External client apps provide enhanced security, streamlined packaging, and a more robust framework for your apps. Existing connected apps and connected apps for Slack in the legacy Agentforce Builder aren't impacted.

[New and Changed Standard Agent Topics and Actions](#)

Quickly add powerful functionality to an agent with new and changed standard agent actions and topics.

Migrate Your Agents' Connected Apps to the External Client App Framework

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With the Spring '26 release, you can no longer create connected apps. For the best customer experience, migrate your connected apps to external client apps. External client apps provide enhanced security, streamlined packaging, and a more robust framework for your apps. Existing connected apps and connected apps for Slack in the legacy Agentforce Builder aren't impacted.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

When: This change is available in early January 2026.

How: To create an external client app from a connected app, open the connected app in App Manager and then click **Migrate to External Client App**. In Agentforce Builder (beta), connect the external client app to your agent using the Messaging connection. After you create an external client app from a connected app, the connected app is read-only in App Manager.

Existing connected apps and external client apps with these OAuth scopes appear in the External Apps list in the Messaging connection.

- Access chatbot services (chatbot_api)
- Access the Salesforce API Platform (sfap_api)
- Manage user data via APIs (api)

New and Changed Standard Agent Topics and Actions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly add powerful functionality to an agent with new and changed standard agent actions and topics.

Availability of standard agent topics, actions, and related prompt templates or flows can vary by edition and license.

January '26

New Topic: ESG Data Collection

Engage with multiple stakeholders and collect environmental, social, and governance (ESG) information.

This topic includes these new actions.

- [Get Vehicle Asset Emission Source Data](#): Answers questions related to the company's ESG data by retrieving data from vehicle assets and returns a list of `VehicleAssetEmissionSrcData` objects.
- [Get Sustainability Stakeholder Data](#): Answers questions related to the stakeholders in the company's ESG data by retrieving stakeholder data related to the stakeholder's role for the reference object associated with this stakeholder.
- [Manage Sustainability Task Group](#): Manages a sustainability task group by sending follow-up emails to stakeholders with incomplete tasks in an existing sustainability task group.
- [Get Sustainability Task Group Data](#): Answers questions related to the task groups in the company's ESG data.
- [Create Sustainability Task Group](#): Creates a sustainability task group by notifying sustainability stakeholders about ESG data collection activities.

New Topic: FinServ Package Wealth Advisor Client Meeting Preparation (Managed Package)

Help wealth advisors gather, review, and organize client details to prepare for a client meeting.

This topic includes these new actions.

- [FinServ Package Summarize Financial Details](#): The Summarize Financial Details action provides wealth advisors with a real-time summary of a household and person account's financial profile within Salesforce Financial Services Cloud.
- [FinServ Package Summarize Financial Goals](#): The Summarize Financial Goals action finds and retrieves financial goals records based on user input. This action provides a real-time summary of a household and person account's financial goals within Salesforce Financial Services Cloud.
- [FinServ Package Summarize Portfolio Performance](#): Provide wealth advisors with real-time summary of an account's financial profile within Salesforce Financial Services Cloud.

New Topic: FinServ Package Wealth Advisor Client Post Meeting Follow Up (Managed Package)

Help wealth advisors manage post meeting tasks by creating financial goals, and life events. Structure and organize meeting notes.

This topic includes these new actions.

- [FinServ Package Create Financial Goal](#): Collect the account ID, status, type, target value, target date and name. Create a financial goal for the account.
- [FinServ Package Create Life Event](#): Collect the account ID, name, date and type. Create a life event related to the account.
- [FinServ Package Extract Financial Goals](#): Extract financial goals from meeting notes. Identify financial goals, types, statuses, target values, and target dates for wealth management advisors.
- [FinServ Package Extract Life Events](#): Extract life events from meeting notes. Identify life events, types, and dates for wealth management advisors.
- [FinServ Package Structure Financial Advisor Meeting Notes](#): Structure and organize meeting notes. Identify the key client details, needs, concerns, and next steps for a follow-up meeting.

New Topic: [Manage Gift Commitments \(Beta\)](#)

Fulfill donor requests to modify, pause, resume, or close their existing gift commitments or recurring donations.

This topic includes these new actions.

- [Agent Action: Close Gift Commitment](#): Close a gift commitment by updating the status of all unpaid and failed transactions to Closed.
- [Agent Action: Manage Recurring Gift Commitment](#): Pause, resumes or update the amount on a recurring gift commitment.

New Action: [Match Volunteers to Shifts](#)

The Match Volunteers to Shifts action finds suitable volunteers to fill open shifts based on the time, location, and qualification requirements. The output of this action can be compiled into a list of potential volunteers to be contacted to sign up for the open shift.

New Topic: [Account Performance](#)

Summarize an account's financial health, retrieve total revenue, analyze performance metrics, and identify top-selling and bottom-selling products within a specified time period. Help users quickly understand sales trends and financial metrics of an account.

This topic includes these new actions.

- [Get Retail Execution Account Performance Data](#): Calculates total revenue, minimum and maximum order values, and identifies top N% and bottom N% selling products based on order quantities.
- [Get Retail Execution Orders By Account](#): Gets order information, including order header details and corresponding detailed order item data for each order of the account.

New Topic: Account Compliance

Analyze store compliance by using past visits, audits, and customer tasks to identify ongoing retail execution issues and gaps. Help users track consistency and adherence to promotional, shelf, and display standards.

This topic includes these new actions.

- **Get Retail Execution Visits By Account:** Get^[1]_{SEP} completed visits for the account based on the preconfigured visit types in Retail^[1]_{SEP} Execution.
- **Get Retail Execution Customer Tasks By Account:** Get customer tasks that are ready or released for an account optionally within a date^[1]_{SEP} range.

New Topic: Last Visit Summary

Get a summary of the most recent store visit, including key activities, compliance outcomes, overdue tasks, and associated order data. Help users streamline visit closure and follow-up activities by providing a snapshot of the most recent account interaction.

This topic includes these new actions.

- **Get Retail Execution Customer Tasks By Account:** Get customer tasks that are ready or released for an account optionally within a date^[1]_{SEP} range.
- **Get Retail Execution Visits By Account:** Get^[1]_{SEP} completed visits for the account based on the preconfigured visit types in Retail^[1]_{SEP} Execution.
- **Get Retail Execution Orders By Visit:** Get order^[1]_{SEP} information, including order header details and corresponding detailed line-item (order^[1]_{SEP} item) data for each order of the visit.

New Topic: Product Upsell

Summarize product recommendations, personalized sales pitches, and out-of-stock (OOS) analysis based on account history and visit notes. Help users identify growth opportunities and customize their product pitch while in the store.

This topic includes these new actions.

- **Get Retail Execution Visits By Account:** Get^[1]_{SEP} completed visits for the account based on the preconfigured visit types in Retail^[1]_{SEP} Execution.
- **Get Retail Execution Orders By Account:** Gets order information, including order header details and corresponding detailed order item data for each order of the account.

Einstein Development

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Develop custom solutions with our suite of generative AI tools, including the Models API, Agentforce, Prompt Builder, and Einstein Studio.

Accelerate Custom Lightning Type Creation for Agentforce with the Lightning Types MCP Tool (Developer Preview)

The Lightning Types Model Context Protocol (MCP) tool in the Salesforce DX MCP Server provides a dynamic way to create and enhance your custom Lightning types. Salesforce DX MCP Server uses large language models (LLMs) to generate the necessary LightningTypeBundle metadata files, including schema.json, editor.json, and renderer.json. You use these custom Lightning types to generate the custom Lightning Web Component (LWC) responses that you're looking for. This feature supports Agentforce Employee agents in Lightning Experience and Agentforce Service agents via Enhanced Chat v2. You can also define structured outputs in Prompt Builder with these Lightning types.

Accelerate Custom Lightning Type Creation for Agentforce with the Lightning Types MCP Tool (Developer Preview)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Lightning Types Model Context Protocol (MCP) tool in the Salesforce DX MCP Server provides a dynamic way to create and enhance your custom Lightning types. Salesforce DX MCP Server uses large language models (LLMs) to generate the necessary LightningTypeBundle metadata files, including schema.json, editor.json, and renderer.json. You use these custom Lightning types to generate the custom Lightning Web Component (LWC) responses that you're looking for. This feature supports Agentforce Employee agents in Lightning Experience and Agentforce Service agents via Enhanced Chat v2. You can also define structured outputs in Prompt Builder with these Lightning types.

Where: The Lightning Types MCP tool is available in the latest version of the Salesforce DX MCP Server (beta).

Note The Lightning Types MCP tool feature is available as a developer preview. Feature isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. All commands, parameters, and other features are subject to change or deprecation at any time, with or without notice. Don't implement functionality developed with these commands or tools.

When: This feature is available starting the week of February 9, 2026.

How: Access the Lightning Types MCP tool, which works with your integrated development environment (IDE), through Agentforce or other MCP clients of your choice. The Salesforce DX MCP Server is

preconfigured in Agentforce Vibes Extension. To interact with the tool, turn on the server in Agentforce, which is a part of Agentforce Vibes Extension. After the server is running, interact with it by using natural language prompts to create, enhance, and get guidance on your custom Lightning types.

Analytics

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Analytics enhancements include new and updated features for Tableau Next, Lightning reports and dashboards, Data 360 reports and dashboards, CRM Analytics, Intelligent apps, and Tableau.

Tableau Next

Tableau Next integrates the #1 analytics platform with Agentforce context-aware AI and the Data Cloud semantic layer that unifies business knowledge across your organization. Build and deliver personalized, contextual, and actionable insights for every user, backed by Salesforce enterprise-grade performance, security, and scalability.

Lightning Reports and Dashboards

Save time and reduce errors when adding tables to dashboards by retaining existing report settings. Ensure policy and regulatory compliance with custom disclaimers on exported reports.

Data 360 Reports and Dashboards

Calculate deeper insights with more row-level formulas.

CRM Analytics

CRM Analytics enhancements include new and updated features for dashboards, lenses, analytics apps, and data integration.

Tableau

Use Tableau to analyze, explore, and make decisions on your data with just a few clicks. Create engaging visualizations and embed them in your Lightning pages to use them in your workflows. Tableau has enterprise analytics platform solutions for deep data exploration.

Marketing Cloud Intelligence

With Marketing Cloud Intelligence, you connect, harmonize, visualize, and act on your marketing data to optimize performance within campaigns, discover insights in real time, and then act on them.

Accessibility Enhancements in Analytics

Learn about small but important changes that make analytics more accessible.

Lightning Reports and Dashboards

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Save time and reduce errors when adding tables to dashboards by retaining existing report settings. Ensure policy and regulatory compliance with custom disclaimers on exported reports.

Use Existing Report Settings When Adding Tables to Dashboards (Generally Available)

Save time and reduce manual configuration of report settings, such as groupings, custom formulas, and bucketing when adding lightning tables to dashboards. This feature reduces the risk of errors and ensures that the tables in the dashboard retain the same configuration as the report. This feature is now generally available.

Ensure Compliance with Custom Disclaimers on Exported Reports

Ensure that your exported reports meet corporate policies and regulatory requirements by appending a custom disclaimer after the standard Salesforce disclaimer.

Share Reports and Dashboards Folders Using Usernames

Securely share report and dashboard folders using precise usernames. Search for users by their usernames, and reduce the risk of sharing sensitive information with the wrong users. Previously, only the name was shown.

Embed Custom Lightning Web Components in Dashboards for Interactive Data Views (Beta)

Add custom Lightning Web Components (LWC) directly into Lightning Dashboards to create interactive, real-time data views that go beyond standard dashboard capabilities. Filter, explore, and act on data immediately without leaving your dashboard. For example, a business analyst can use a custom LWC to display a waterfall chart or other visualizations that are not available in standard dashboards.

Use Existing Report Settings When Adding Tables to Dashboards (Generally Available)

This release is in preview

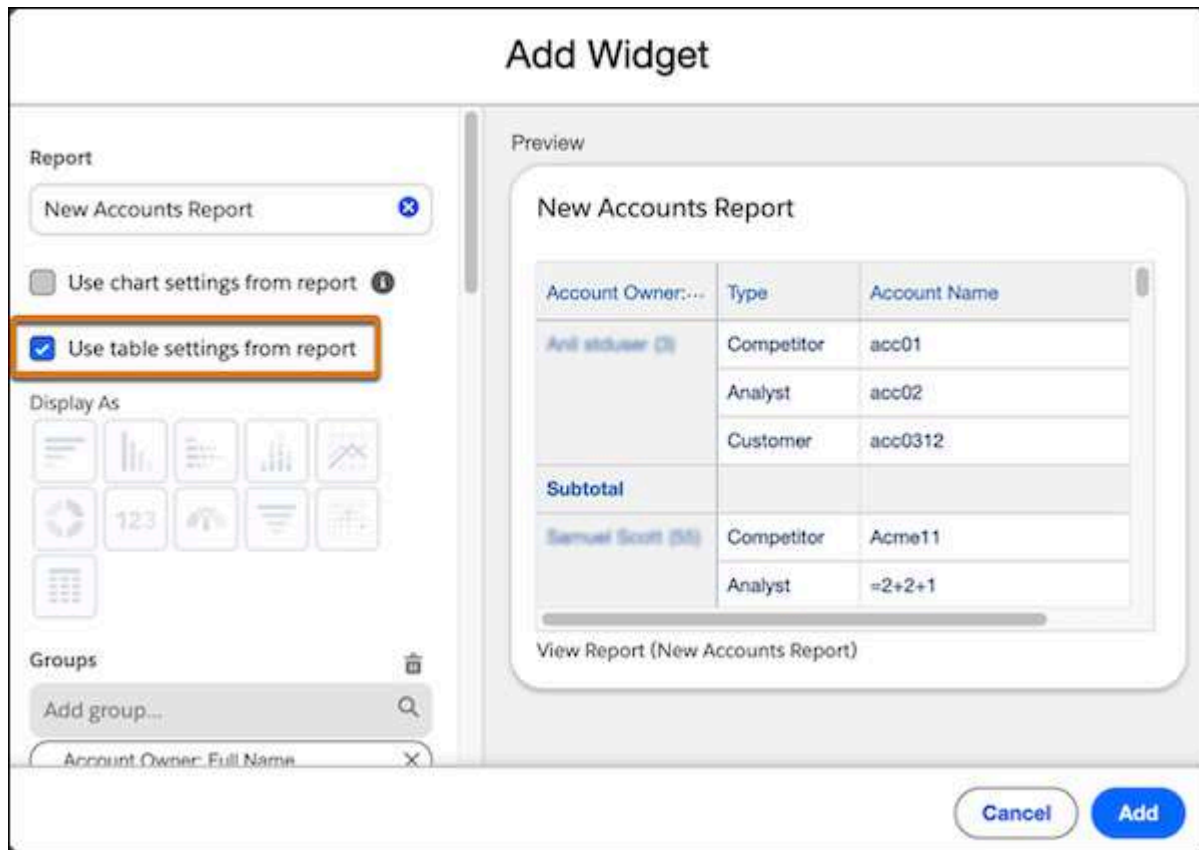

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Save time and reduce manual configuration of report settings, such as groupings, custom formulas, and bucketing when adding lightning tables to dashboards. This feature reduces the risk of errors and ensures that the tables in the dashboard retain the same configuration as the report. This feature is now generally available.

Where: This change applies to Lightning Experience in Enterprise, Professional, and Unlimited editions.

How: In Setup, in the Quick Find box, enter *Reports* and select **Reports and Dashboards Settings**.

Select **Apply report settings to dashboard tables**. When adding a Lightning table to your dashboard, select **Use table settings from report**.

Ensure Compliance with Custom Disclaimers on Exported Reports

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Ensure that your exported reports meet corporate policies and regulatory requirements by appending a custom disclaimer after the standard Salesforce disclaimer.

Where: This change applies to Lightning Experience in Enterprise, Professional, and Unlimited editions.

How: In Setup, in the Quick Find box, enter *Reports* and select **Reports and Dashboards Settings**. Select **Use Custom Disclaimer on Exported Reports**. In the text box, enter the custom disclaimer to show after the default Salesforce disclaimer.

Embed Custom Lightning Web Components in Dashboards for Interactive Data Views (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Add custom Lightning Web Components (LWC) directly into Lightning Dashboards to create interactive, real-time data views that go beyond standard dashboard capabilities. Filter, explore, and act on data immediately without leaving your dashboard. For example, a business analyst can use a custom LWC to display a waterfall chart or other visualizations that are not available in standard dashboards.

Where: This change applies to Lightning Experience in Enterprise, Professional, and Unlimited editions.

Note Embed Custom Lightning Web Components in Lightning Dashboards is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

How: To turn on this feature, contact Salesforce Customer Support. Then, in the dashboard edit mode, click **+Widget** and select **Lightning Web Component**. Configure the properties of the custom Lightning web component, and add the component to the dashboard.

Data 360 Reports and Dashboards

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Calculate deeper insights with more row-level formulas.

Expand Reporting Capabilities with More Row-Level Formulas

Save time on reporting and generate deeper insights by including up to five row-level formulas in your Data 360 reports. Calculate values directly in the report without adding formula fields on an object. For example, calculate both the commission rate and the time-to-close metric in a single report without adding a formula field on the object. Previously, reports supported only one row-level formula.

Expand Reporting Capabilities with More Row-Level Formulas

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. CRM Analytics

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

CRM Analytics enhancements include new and updated features for dashboards, lenses, analytics apps, and data integration.

Analytics Experience and Visualizations

Download Data 360 object data from lenses and widgets to CSV or Excel files. Take action across many assets with bulk actions. Query data more effectively with the new Data 360 SQL variant (beta).

Analytics Data Integration

Write and schedule your custom CRM Analytics recipes to output your transformed data directly to Data 360 data lake objects. Securely access your Amazon Redshift data by using a virtual private connection. Take advantage of OAuth functionality in your Microsoft Azure SQL Database connection.

Analytics Experience and Visualizations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Download Data 360 object data from lenses and widgets to CSV or Excel files. Take action across many assets with bulk actions. Query data more effectively with the new Data 360 SQL variant (beta).

Analyze Data Offline with CSV and Excel Exports of Data 360 Objects

Export data directly from lenses and widgets that use data from Data 360 objects, such as data lake objects, data model objects, and calculated insights. Save up to 50,000 rows as an Excel or CSV file to use offline features, such as applying advanced filters, integrating with external tools, and performing complex calculations.

Download CRM Analytics Dashboard Images

Share insights faster by directly downloading an image of your CRM Analytics dashboard from the dashboard view. Previously, you had to use the Share window to download dashboard images.

Manage CRM Analytics Assets with New Bulk Actions

Minimize the risk of human error associated with repetitive manual tasks and manage multiple CRM Analytics assets efficiently with new bulk actions. You can now add or remove Favorites, and hide or

show assets. You can perform bulk actions on up to 50 assets at a time. Previously, bulk actions were limited to Change Owner and Add to Collection.

Speed Up Queries and Improve Data Handling with Data 360 SQL (Beta)

Enhance data handling, strengthen security, and speed up query responses by using Data 360 SQL. New compact form queries and custom SQL queries now run on Data 360 SQL by default. Existing custom SQL queries continue to use legacy SQL, and you can manually switch them to Data 360 SQL for improved performance.

Repeat Groupings in Compare Tables with Repeat Row Values

You can now configure a compare table to replicate group dimension values on every row with Repeat Row Values. Tables with group dimensions, such as name or product, automatically repeat the group value on every row. This enhancement helps improve readability of large datasets without constant scrolling back to the first occurrence.

Gain Full Control over Number Widget Tooltips

You can now suppress default tooltip bubbles on number widgets that don't have custom messages. Get more control over the widget's visual presentation and give your users a cleaner dashboard experience.

Explore Pivot Tables with Expand and Collapse

You can now expand and collapse groups and sub-groups in pivot tables to help you focus on specific insights and customize your view of large datasets.

Keep Widget Action Menus Visible

Keep important widget actions, such as downloading and sharing, always in sight for chart, number, text, repeater, list, toggle, date, range, and table widgets. Quickly access widget actions without needing to hover over the widget.

Analyze Data Offline with CSV and Excel Exports of Data 360 Objects

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Export data directly from lenses and widgets that use data from Data 360 objects, such as data lake objects, data model objects, and calculated insights. Save up to 50,000 rows as an Excel or CSV file to use offline features, such as applying advanced filters, integrating with external tools, and performing complex calculations.

Where: This change applies to CRM Analytics in Lightning Experience and Salesforce Classic. CRM Analytics is available in Developer Edition and for an extra cost in Enterprise, Performance, and Unlimited editions.

Who: To download Data 360 data as an Excel and CSV file, you need the Download CRM Analytics Data permission.

How: Select a widget that contains data from a Data 360 object. From the widget's action, click **Download**. You can download the data in Excel, Excel with Metadata, or CSV format.

The Excel with metadata file includes the filters applied, groupings applied on columns, and count of records.

Download CRM Analytics Dashboard Images

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Share insights faster by directly downloading an image of your CRM Analytics dashboard from the dashboard view. Previously, you had to use the Share window to download dashboard images.

Where: This change applies to CRM Analytics in Lightning Experience and Salesforce Classic. CRM Analytics is available in Developer Edition and for an extra cost in Enterprise, Performance, and Unlimited editions.

How: Click the Download icon  on the CRM Analytics dashboard. Then select **Download as Image** to download an image in PNG format.

Manage CRM Analytics Assets with New Bulk Actions

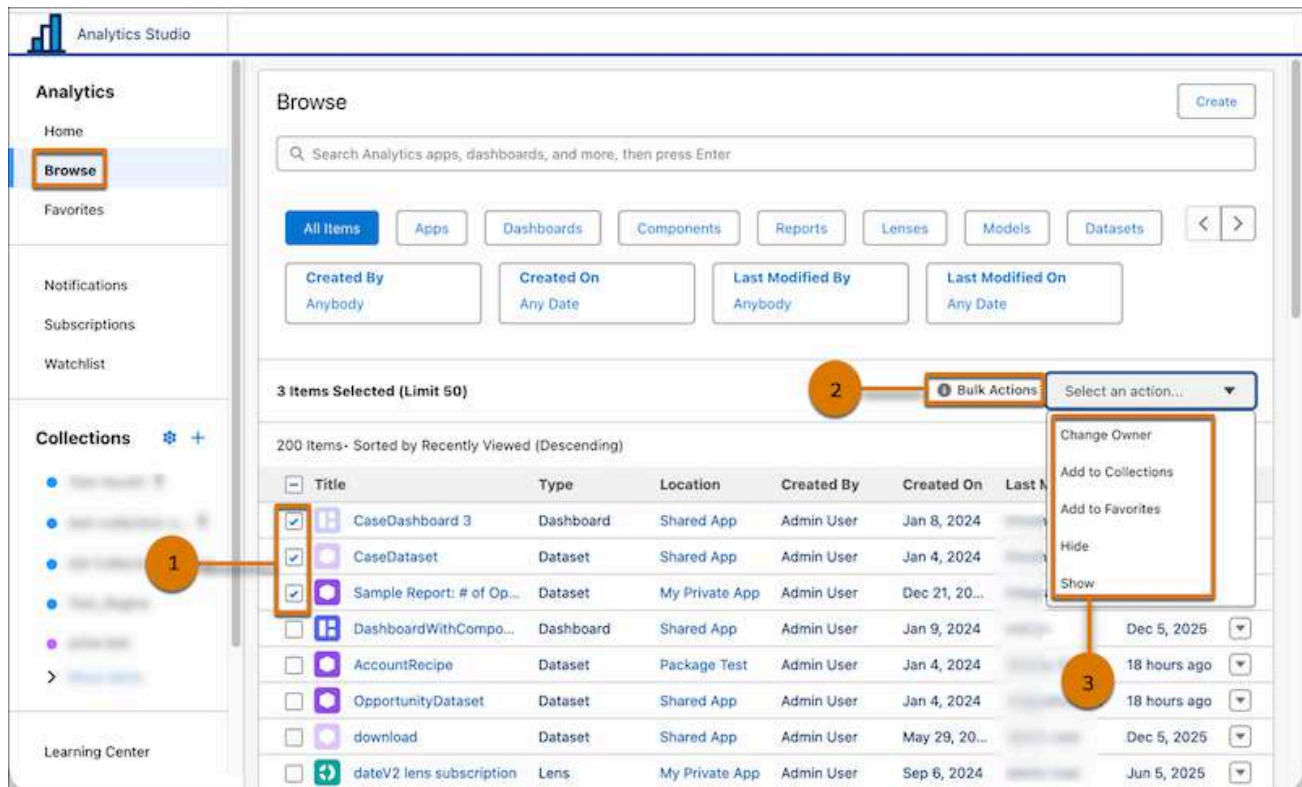

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Minimize the risk of human error associated with repetitive manual tasks and manage multiple CRM Analytics assets efficiently with new bulk actions. You can now add or remove Favorites, and hide or show assets. You can perform bulk actions on up to 50 assets at a time. Previously, bulk actions were limited to Change Owner and Add to Collection.

Where: This change applies to CRM Analytics in Lightning Experience and Salesforce Classic. CRM Analytics is available in Developer Edition and for an extra cost in Enterprise, Performance, and Unlimited editions.

How: In Analytics Studio, click **Browse**, and select the items that you want to update (1). From the Bulk Actions dropdown (2), select a bulk action (3).

Speed Up Queries and Improve Data Handling with Data 360 SQL (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance data handling, strengthen security, and speed up query responses by using Data 360 SQL. New compact form queries and custom SQL queries now run on Data 360 SQL by default. Existing custom SQL queries continue to use legacy SQL, and you can manually switch them to Data 360 SQL for improved performance.

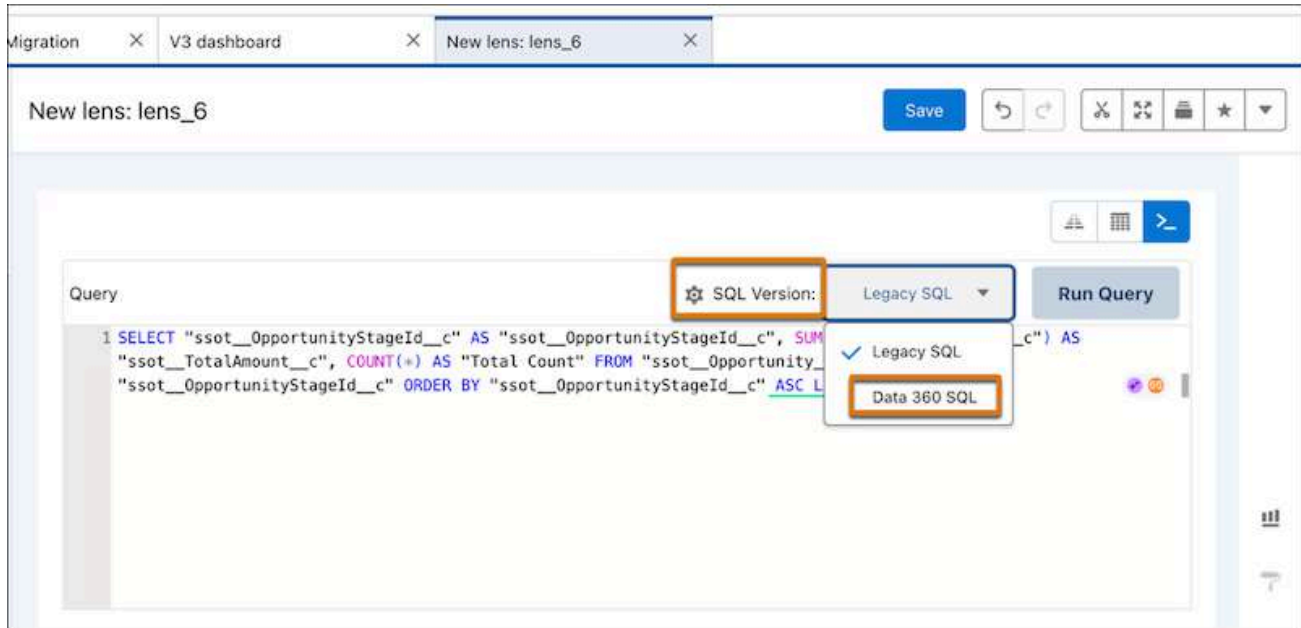

Where: This change applies to CRM Analytics in Lightning Experience and Salesforce Classic. CRM Analytics is available in Developer Edition and for an extra cost in Enterprise, Performance, and Unlimited editions.

Note Improved Data Handling with Data 360 SQL is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by

Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

How: Select a lens that contains a custom SQL query. In the custom SQL query editor, click the **SQL Version** dropdown and select **Data 360 SQL**.

In the confirmation window, click **Change to Data 360 SQL**, and then click **Update**.

You can't change the SQL version of a query back to Legacy SQL once you have changed it to Data 360 SQL.

Analytics Data Integration

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Write and schedule your custom CRM Analytics recipes to output your transformed data directly to Data 360 data lake objects. Securely access your Amazon Redshift data by using a virtual private connection. Take advantage of OAuth functionality in your Microsoft Azure SQL Database connection.

[Use CRM Analytics Datasets in Data Cloud \(Generally Available\)](#)

Take advantage of the latest Data 360 features while retaining the functionality of CRM Analytics recipes. Write and schedule your custom CRM Analytics recipes to output your transformed data directly to Data 360 data lake objects (DLO). Then you can use your CRM Analytics data to create calculated insights, semantic models, and Data 360 reports and dashboards. This feature, now generally available, includes a change since the last release: Users can now select a category on the DLO.

[Securely Connect Your Private Redshift Data to CRM Analytics](#)

Integrate data from your private Amazon Redshift data warehouse into CRM Analytics. Use a virtual private connection (VPC) to make sure that all data transfer happens over an internal network, bypassing the public internet for enhanced security and compliance.

Use OAuth Security with Your Microsoft Azure SQL Database Connection

Increase data security by connecting to Microsoft Azure SQL Database using OAuth 2.0 authentication. You can now provide Azure authentication values directly, eliminating the need for a separate external authentication provider setup.

Improve Snapshot Data Recipe Performance with Optimized Upsert and Delete Actions (Generally Available)

Decrease processing time with quicker data recipe runs. Instead of processing all rows in the snapshot data, the optimized upsert and delete actions run incrementally on subsets of the snapshot data, resulting in faster runs. This feature is now generally available.

Use CRM Analytics Datasets in Data Cloud (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

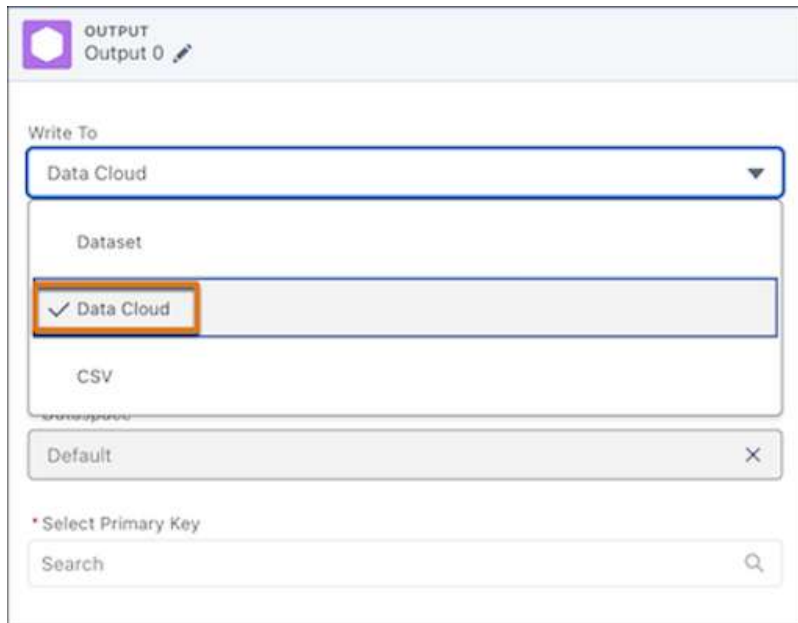

Take advantage of the latest Data 360 features while retaining the functionality of CRM Analytics recipes. Write and schedule your custom CRM Analytics recipes to output your transformed data directly to Data 360 data lake objects (DLO). Then you can use your CRM Analytics data to create calculated insights, semantic models, and Data 360 reports and dashboards. This feature, now generally available, includes a change since the last release: Users can now select a category on the DLO.

Where: This change applies to CRM Analytics in Lightning Experience and Salesforce Classic. CRM Analytics and Data 360 are available for an extra cost in Enterprise, Performance, and Unlimited editions.

Why: For example, prevent churn with a DLO built from your transformed CRM Analytics recipe that calculates a Churn Risk Score for each customer. Calculate the score from factors like case escalations and declining purchases, and add it to the unified profile. Then, create a high-risk customer segment in Data 360 to start a Marketing Cloud retention journey.

How: From Setup, in the Quick Find box, enter and select *Analytics*, then select **Settings**. Select **Enable CRM Analytics recipe to write output dataset to Data Cloud** and then save your changes.

In Data Manager, in the recipe editor, specify **Data Cloud** as the Write To value in your output node.

Learn about small but important changes that make analytics more accessible.

Where: Lightning Report and Dashboard changes apply to Lightning Experience in Group, Professional, Enterprise, Performance, Unlimited, and Developer editions. CRM Analytics changes apply to CRM Analytics in Lightning Experience and Salesforce Classic. CRM Analytics is available in Developer Edition and for an extra cost in Enterprise, Performance, and Unlimited editions.

How: Check out details about these changes.

Lightning Reports and Dashboards

- Keyboard users can now interact with column headers in custom report types to access sorting and action buttons.
- Horizontal scrolling in report tables now adjusts automatically to provide full visibility of cell content when navigating with a keyboard at 200% zoom.
- The Year selection combobox is now correctly identified as an interactive control to ensure screen readers announce it accurately.
- Column header text now meets minimum color contrast requirements on hover to improve label visibility for users with low vision.
- Screen readers now announce the success message when a recipient is added in the Edit Recipient dialog.
- Focus behavior in the Edit Subscription dialog is improved to ensure that the focus moves to newly added fields after clicking the Add Condition button.
- Keyboard focus now returns to the table after exiting Navigation Mode with Shift+Tab to ensure predictable and consistent navigation.
- Grid cells in report tables no longer announce “not selected” by default to reduce unnecessary verbosity for assistive technology users.
- Accessible names for X-axis and Y-axis fields in chart properties now match visible labels to provide clearer context for screen reader users.
- The Category list in the Choose Report Type modal now includes a defined accessible name to ensure accurate identification of list items for screen readers.
- Tooltips triggered by the Close Filter Panel button are now dismissible and remain visible on hover to improve usability and clarity.

- The vertical scroll bar now functions correctly when the dashboard page is zoomed to 400% to ensure that main content remains reachable.
- Screen readers now announce the expanded or collapsed state of the Who Can Access accordion in the Share Folder dialog to provide accurate context for non-visual users.
- Non-interactive legend buttons beside charts are removed from the keyboard focus order to reduce misleading or unnecessary navigation.
- Tooltips in Sales Dashboards can now be activated using the Enter or Space key to provide access for users who can't use a mouse.
- Measure lines in vertical bar charts now use a color distinct from the chart bars to improve visibility and contrast.
- The close button in dashboard widget modals is now announced in the user's selected language to ensure a consistent and localized experience.
- Screen readers now announce the status update for the As of timestamp when users activate the Refresh button to provide clear feedback on data freshness.
- The As of tooltip link now includes an accessible name to ensure that screen reader users understand its destination and purpose.
- Action buttons, such as Share, Refresh, and Edit are now marked up as a list to provide more efficient and structured navigation for assistive technology users.

CRM Analytics

- Screen readers now announce assistive text for widget containers in the Watchlist tab.

Commerce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Commerce enhancements include features for B2B Commerce, Omnichannel Inventory, and Salesforce Order Management.

Commerce is now Agentforce Commerce. You might continue to see the former name in our application and documentation.

Salesforce B2B Commerce

Learn about the latest B2B Commerce features released by month. Give buyers the option to request a quote directly from their cart. Customize your pricing setup to support complex pricing rules by using context extension services. Streamline procurement by offering products that buyers can configure and purchase. Allocate resources strategically for larger, more complex product catalogs with an increased searchable and filterable field limit.

Omnichannel Inventory

Prevent overstocking with safety stock caps.

Salesforce Order Management

Simplify delivery estimations by configuring locations and shipping methods in the same window.

Monitor critical order fulfillment performance in a new analytics dashboard. Enjoy more flexibility and customization when capturing payments.

Salesforce B2B Commerce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about the latest B2B Commerce features released by month. Give buyers the option to request a quote directly from their cart. Customize your pricing setup to support complex pricing rules by using context extension services. Streamline procurement by offering products that buyers can configure and purchase. Allocate resources strategically for larger, more complex product catalogs with an increased searchable and filterable field limit.

Salesforce B2B Commerce Features Released Monthly

Many B2B features and changes are released as often as monthly, so check back again soon for the latest solutions. The Spring '26 release includes updates happening from January through April 2026.

Agentforce for B2B Commerce

Help your guided shopping agents and buyers interact in their preferred language.

Commerce Cart, Checkout, and Shipping

Accelerate negotiations and close deals faster by providing buyers an option to request a quote. Customize pricing rules by extending the pricing context definition.

Commerce Components

Build richer, more dynamic storefront experiences with Lightning Web Runtime (LWR) store components.

Commerce Search

Know immediately when a product is at risk of being unsearchable. Allocate resources strategically for larger, more complex product catalogs with an increased searchable and filterable field limit.

Commerce Subscriptions

Bundle multiple digital subscription products together to enable buyers to add related products to their cart in a single action. Buyers can also view their subscription history from the Commerce subscriptions page.

Commerce Additional Features

Reduce dependency on sales reps by offering products that buyers can configure and purchase. Simplify catalog management with dynamic rules that automatically show or hide products based on

buyer eligibility.

Make your purchase decisions only on the basis of generally available products and features.

Accelerate negotiations and close deals faster by providing buyers an option to request a quote. Customize pricing rules by extending the pricing context definition.

Let Buyers Request a Quote from Their Cart

Streamline negotiations by giving B2B buyers the option to request a quote directly from their cart. After the buyer submits the request, your team can review the details, negotiate as needed, and place the order on the buyer's behalf. Manage pricing and shorten deal cycles by reducing handoffs for complex purchases that require negotiation and approvals.

Extend B2B Store Pricing Rules with Custom Context Definitions

Customize pricing rules for complex business scenarios by integrating custom fields into your pricing procedure. Extend the Commerce cart context definition to inherit standard components, such as nodes, attributes, and mappings. Tailor the pricing procedure by adding account and product attributes to the extended context definition.

Let Buyers Request a Quote from Their Cart

Know immediately when a product is at risk of being unsearchable. Allocate resources strategically for larger, more complex product catalogs with an increased searchable and filterable field limit.

Identify Products at Risk of Being Unsearchable

To avoid indexing failures, an error message now prompts you when a product SKU is assigned to more than 250 categories. This message helps you identify and adjust category assignments to make sure that your buyers can find the relevant products in the search results.

Product Catalogs Include More Searchable and Filterable Fields

Previously, the search index was limited to 25 searchable fields and 50 filterable fields. Now, you can have a total of 100 searchable and filterable fields, enabling you to allocate resources strategically for larger, more complex product catalogs.

Commerce Additional Features

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reduce dependency on sales reps by offering products that buyers can configure and purchase. Simplify catalog management with dynamic rules that automatically show or hide products based on buyer eligibility.

Sell Configurable Products in Your B2B Store

Streamline procurement and reduce the need for sales rep involvement by offering products that buyers can configure and purchase. Pricing updates as the buyer adds or changes the configuration. Buyers can discover products through search, configure them to their needs, and either place an order or request a quote via a self-service flow.

Determine Product Visibility Dynamically by Using Qualification Rules

To evaluate product and product category eligibility, your B2B Commerce store applies entitlement policies that you've configured. However, if you have thousands of products, preconfiguring entitlement policies can get challenging. To make it easier to manage large numbers of products and product categories across your stores, create qualification rules that dynamically evaluate eligibility based on account or category attributes. You can also set up a disqualification rule to exclude products and product categories from a buyer's view. If you enable qualification rules, your store uses qualification rules instead of entitlement policies.

Apply export filters from Translation Workbench. Import valid files, even when there are invalid files in the bundle. Update Custom Labels from Translation Workbench. Access revised state codes for Canada and Japan. Get updated translations for some standard objects.

List Views

When you sort a list view, blank fields are sorted as the highest value in the list instead of the lowest value. In list views rendered with Lightning Web Components (LWC), you receive an error notification earlier in the edit process if you try to edit more than 200 records at a time.

AppExchange

Configure new Trialforce Source Org (TSO) branded login pages before Summer '26.

General Setup

Add the Request Approval component to record pages so users can submit records for approval without the need for a custom button. Install a release update to address new sharing recalculation behavior.

Setup with Agentforce (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Simplify administrative tasks by using the new AI-powered agent in Setup.

Note Setup with Agentforce is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Streamline Administrative Tasks with Setup with Agentforce (Beta)

Salesforce's new agent-driven Setup experience integrates Setup with an AI assistant to simplify administrative tasks. Chat with the agent to issue commands or ask questions by using natural language. The agent makes activities like creating objects and flows, managing user access, and troubleshooting formulas more intuitive and efficient, reducing navigation and clicks.

Streamline Administrative Tasks with Setup with Agentforce (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce's new agent-driven Setup experience integrates Setup with an AI assistant to simplify administrative tasks. Chat with the agent to issue commands or ask questions by using natural language. The agent makes activities like creating objects and flows, managing user access, and troubleshooting formulas more intuitive and efficient, reducing navigation and clicks.

Where: This feature is available in Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Foundations or Agentforce 1 editions.

Note Setup with Agentforce is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

When: This feature is available starting in early January 2026.

Who: To use Setup with Agentforce, users must have these permissions: Use Setup with Agentforce and Execute Prompt Template. Users must also have access to the Data 360 default data space and the required permissions for the task they want to perform.

Why: Setup with Agentforce is available from every page in Setup. You can chat with the agent in the Agentforce panel while still viewing and navigating through Setup. And when necessary, the conversation can transition into a full-sized agentic experience that opens new conversations in different console tabs and includes a canvas to display rich content such as record details, list views, and metadata previews.

This tool uses generative AI, which can produce inaccurate or harmful responses. [Learn more.](#)

Setup with Agentforce also updates the Setup Home page released in Winter '26 with a prompt bar, org health and usage metrics, and conversation recommendations to get you started working quickly with an agent to complete common tasks.

144

The new Setup agent supports many more Setup tasks than the previously released Agent for Setup, including:

- Managing users
- Troubleshooting user access
- Managing permission sets, permission set groups, organization-wide defaults, and sharing rules
- Creating custom objects and fields
- Creating and managing flows
- Getting information from Salesforce Help
- Navigating to the right Setup page to complete a task
- Creating a custom report type
- Creating Lightning pages
- Fixing issues and getting an explanation of formulas
- Getting information about usage and licenses

How: Before enabling Setup with Agentforce, [ensure that Data Cloud is set up in your org](#). Then, if you haven't yet, enable [generative AI](#) and then enable [Agentforce](#).

To enable Setup with Agentforce, from Setup, enter *Agentforce* in the Quick Find box, and then click and turn on **Setup with Agentforce (Beta)**. Then refresh your browser.

On Setup Home, start a conversation by using the prompt bar, conversation recommendations, or the Ask Agentforce buttons in the Org Health and Usage section.

On any other Setup page, click the **Ask Agent for Setup (Beta)** button (). During the conversation, you see record details, list views, documentation, and other items that you can expand for additional information.

Globalization

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Apply export filters from Translation Workbench. Import valid files, even when there are invalid files in the bundle. Update Custom Labels from Translation Workbench. Access revised state codes for Canada and Japan. Get updated translations for some standard objects.

Export and Import Translated Files with Ease

Reduce metadata translation file size and complexity with export filters. Now, you can filter metadata translation files for export from the Translation Workbench when you select metadata components and date ranges. To improve the import experience, when you import translated files that contain invalid records, the valid records are imported.

Speed Up Custom Label Updates in Translation Workbench

Save time by updating custom labels directly within the Translation Workbench user interface, instead of navigating to the Custom Labels setup section.

Use Updated State Codes for Picklists

When you use standard country/territory address picklists, some country and territory states/provinces have special considerations for their state codes. You can now access the updated state codes for Canada and Japan in Salesforce orgs created in Spring '26 and later, helping you maintain data quality.

Review Updated Label Translations

To improve accuracy and your users' experience, we updated the translations for some standard object, tab, and field names for these languages: Chinese (Simplified), Chinese (Traditional), Dutch, Finnish, French, Japanese, Korean, Norwegian, Polish, Slovenian, Thai, and Turkish.

Enable ICU Locale Formats (Release Update)

With this update, the International Components for Unicode (ICU) locale formats replace Oracle's Java Development Kit (JDK) locale formats in Salesforce. Locales control the format for dates, times,

currencies, addresses, names, numeric values, and the start day of the week. ICU sets the international standard for these formats. The ICU locale formats provide a consistent experience across the platform and improve integration with ICU-compliant applications across the globe. This update was first made available in Winter '20. Orgs that haven't already switched to ICU locale formats are encouraged to manually update.

Export and Import Translated Files with Ease

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reduce metadata translation file size and complexity with export filters. Now, you can filter metadata translation files for export from the Translation Workbench when you select metadata components and date ranges. To improve the import experience, when you import translated files that contain invalid records, the valid records are imported.

Where: This change applies to Lightning Experience and Salesforce Classic in all editions.

Who: To export metadata files from the Translation Workbench, admins and developers need the Manage Translation and Create Documents permissions.

Why: Filtering provides granular control, helps create smaller, more efficient translation packages, and you can create highly precise translation files. For example, you can limit the export to only records modified since a specific date. Or, you can focus on recently changed items when you define a date range based on the source's last modified date.

When you import translated files that contain invalid records, the valid records are imported. All errors are reported and the error report is a link to a .zip archive. Previously, only up to 50 errors were reported, there was complete failure or success, and the error report was available as an email attachment.

How: To create files for your translators that contain your Salesforce org's translatable metadata, from Setup, in the Quick Find box, enter *Export*, and then select **Export**. If data translation is enabled, select the Metadata translation type. Then filter by Salesforce Setup components or by modification date.

Use Updated State Codes for Picklists

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

When you use standard country/territory address picklists, some country and territory states/provinces have special considerations for their state codes. You can now access the updated state codes for Canada and Japan in Salesforce orgs created in Spring '26 and later, helping you maintain data quality.

Where: This change applies to Lightning Experience and Salesforce Classic in all editions.

Why: For Canada, the state/province name Yukon Territories (YT) is available in orgs created in Winter '26 and earlier. The state/province name Yukon (YT) is available in orgs created in Spring '26 and later.

For Japan, the state codes for 02 (Aomori), 05 (Akita), and 23 (Aichi) and their state/province names have changed.

- 02 is the state code for the state/province Aomori for orgs created in Spring '26 and later. For orgs

- created in Winter '26 and earlier, the state code is 23.
- 05 is the state code for the state/province Akita for orgs created in Spring '26 and later. For orgs created in Winter '26 and earlier, the state code is 02.
- 23 is the state code for the state/province Aichi for orgs created in Spring '26 and later. For orgs created in Winter '26 and earlier, the state code is 05.

Enable ICU Locale Formats (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With this update, the International Components for Unicode (ICU) locale formats replace Oracle's Java Development Kit (JDK) locale formats in Salesforce. Locales control the format for dates, times,

currencies, addresses, names, numeric values, and the start day of the week. ICU sets the international standard for these formats. The ICU locale formats provide a consistent experience across the platform and improve integration with ICU-compliant applications across the globe. This update was first made available in Winter '20. Orgs that haven't already switched to ICU locale formats are encouraged to manually update.

Where: This change applies to Lightning Experience, Salesforce Classic, and all versions of the Salesforce mobile app in all editions, except Database.com.

When: To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and then click the maintenance tab.

Who: You can enable this update for all orgs. To use the ICU locale formats in your customizations, all Apex classes, Apex triggers, and Visualforce pages must use API version 45.0 or later.

How: To manually enable this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. To Enable ICU Locale Formats, follow the testing and activation steps.

The English (Canada) locale (en_CA) requires separate activation. From Setup, in the Quick Find box, enter *User Interface*, and select **User Interface**. Then select **Enable ICU formats for en_CA**, and save your changes.

To confirm whether your org is using ICU or JDK locale formats, from Setup, enter *Company Information* in the Quick Find box. On the Company Information page, locate the Locale Formats field.

The enablement of this release update is not enforced in Spring '26. If your org is already using ICU locale formats, those locale formats remain enabled. For any org still using JDK, we recommend that they use the release update to manually enable ICU locale formats.

List Views

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

When you sort a list view, blank fields are sorted as the highest value in the list instead of the lowest value. In list views rendered with Lightning Web Components (LWC), you receive an error notification earlier in the edit process if you try to edit more than 200 records at a time.

List View Edit Limits Are Communicated More Clearly

List views rendered with Lightning Web Components (LWC) now prevent you from selecting or attempting to edit more than the supported maximum of 200 records at one time. Previously, if you selected more than 200 records, the edit icon still appeared and Salesforce didn't restrict you from changing a field. However, when you attempted to apply your changes, an error notified you that your changes were unsaveable. To save you time and prevent the input of changes that can't be saved, list views now enforce the 200-record limit earlier in the edit process.

Use Updated Empty Value Placement in List View Sorting

When you sort a list view, blank fields, or null values, now are treated as the highest value in the dataset. For example, let's say you have a column with the data 5, 9, null, and 2. If you sort this column in ascending order, you see 2, 5, 9, null. Previously, Salesforce treated blank fields as the lowest value, so that in the example given, you saw the data as null, 2, 5, 9.

Whether you're using Lightning components, Visualforce, Apex, or Salesforce APIs with your favorite programming language, these enhancements help you develop amazing applications, integrations, and packages for resale to other organizations.

Lightning Components

Use complex expressions in your LWC templates. Lightning base components for empty states and illustrations are in beta. The TypeScript rollout for all Lightning base components is complete. Screen flows now support Lightning Web Component local actions. The LWC TypeScript Converter MCP Tool is in beta. Use the Error Console to keep non-fatal errors from interrupting you. Learn about the latest improvements to Lightning Out 2.0.

Lightning Design System

The Salesforce Lightning Design System (SLDS) includes the resources to create user interfaces consistent with Salesforce Lightning principles, design language, and best practices.

Visualforce

Visualforce contains a release update in Spring '26, a continuation of an earlier release update.

Apex

Run only Apex tests that are relevant to a deployment by using the `RunRelevantTests` (beta) test level. Apex cursors and pagination cursors are enhanced and generally available. Extract picklist fields by using the `ConnectApi.RecordUi.getPicklistValuesByRecordType()` method. Exposing Apex REST and AuraEnabled controller methods as agent actions is generally available. The `Blob.toPdf()` method uses the same PDF rendering service as Visualforce. Prepare your Apex code for changes to sharing recalculation behavior. Filter Test Discovery API results by using the `category` query parameter. Specify the number of oldest, completed async jobs to delete by using the method overload for `purgeOldAsyncJobs()`.

API

Learn about improvements, new capabilities, and important announcements in API version 66.0.

Packaging

Packaging facilitates the development and distribution of business apps. Use second-generation managed packages to create apps to sell and distribute on AppExchange. Use unlocked packages to develop internal business apps.

Development Environments

Development environments are full-featured Salesforce environments that you use to develop and test existing or new features and custom applications. They include Developer Edition orgs, sandboxes, and scratch orgs.

Monitor Sandbox Copy Progress in Greater Detail with an Updated UI

The updated UI for sandbox copies and refreshes now provides a detailed visual progress bar and real-time status updates for each stage. Users gain greater insight and transparency into the process, enabling better tracking of sandbox progress and completion.

Platform Development Tools

Build applications collaboratively and deliver continuously with Salesforce Developer Experience (DX), the open and integrated experience for custom app development on Salesforce.

Salesforce Functions

Salesforce Functions is no longer available for purchase or renewal. Learn about the retirement plan

for Salesforce Functions.

Change Data Capture

Rollback of custom formula fields

Platform Events

Check out outbound message enhancements.

New and Changed Items for Developers

Here is where you can find new and changed objects, calls, classes, components, commands, and more that help you customize Salesforce features.

Lightning Components

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use complex expressions in your LWC templates. Lightning base components for empty states and illustrations are in beta. The TypeScript rollout for all Lightning base components is complete. Screen flows now support Lightning Web Component local actions. The LWC TypeScript Converter MCP Tool is in beta. Use the Error Console to keep non-fatal errors from interrupting you. Learn about the latest improvements to Lightning Out 2.0.

Note Looking for [new and changed Lightning web components, Aura components, and Aura component interfaces](#)? See the lists of new and changed items at the end of the Development section.

LWC API Version 66.0

Update the API version for your components to use new features and improvements. Versioning your Lightning web components ensures that your existing components aren't affected when Salesforce ships new features, bug fixes, and performance improvements that change existing behavior. Versioning also helps Salesforce deprecate legacy features.

Display Consistent Empty State Illustrations With Theme Support (Beta)

Use the new `lightning-empty-state` component to add meaningful visuals and content to your components that show empty states. This component displays the latest Salesforce Lightning Design System (SLDS) empty state illustration and correctly sizes it for the container, simplifying your UI development. The SVG illustrations automatically adjust to the user's selected theme, and can adapt to dark mode in SLDS 2 themes, for a consistent look and feel across your app. The new `lightning-illustration` component displays the same set of illustrations without text.

Get Complete Type Definitions for Lightning Base Components

Build your apps with confidence with the completion of the TypeScript rollout for all Lightning base

components.

[Improve Type Safety with the LWC TypeScript Converter MCP Tool \(Beta\)](#)

Use natural language prompts to automate the conversion of JavaScript files to TypeScript for LWC development.

[Update Your Custom Components for Use in Setup with Agentforce \(Beta\)](#)

Make your custom Aura and Lightning web components accessible to Agentforce in Setup by adding AI-related component and property descriptions to their `js-meta.xml` and `.design` files. AI component and property descriptions are used only in orgs that have Setup with Agentforce (beta) enabled.

[Check For Errors From the Disconnected DOM Node Rehydration Fix](#)

To improve framework consistency, Lightning web components now rehydrate only when they're actively connected to the DOM. For example, rehydration skips detached nodes to prevent lifecycle methods like `renderedCallback` from firing multiple times. Previously, certain edge cases allowed disconnected DOM nodes to be rehydrated, which could trigger reactive state updates or function invocations on detached components.

[Manage Page Errors with Error Console](#)

Enable the Error Console to capture and display component and page errors without interrupting your work in Salesforce. The console collects non-fatal errors so you can see them when it's convenient for you, and they don't require interaction. Fatal errors still show in modal error panels that you must dismiss before continuing. Fatal errors are also collected in the Error Console for later inspection.

[Do More with Lightning Out 2.0 Improvements](#)

Learn about improvements to Lightning Out 2.0 and the Lightning Out 2.0 App Manager.

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Update the API version for your components to use new features and improvements. Versioning your Lightning web components ensures that your existing components aren't affected when Salesforce ships new features, bug fixes, and performance improvements that change existing behavior. Versioning also helps Salesforce deprecate legacy features.

Where: This change applies to custom Lightning web components in Lightning Experience, Experience Builder sites, and all versions of the Salesforce mobile app.

How: You can change a component's API version in its `.js-meta.xml` file.

```
<?xml version="1.0" encoding="UTF-8"?>
  <LightningComponentBundle xmlns="http://soap.sforce.com/2006/04/metadat
a">
    <apiVersion>66.0</apiVersion>
  </LightningComponentBundle>
```

 **Important** We recommend that you upgrade your component API version one version at a time. For example, from 58.0, upgrade from 58.0 to 59.0, fix any errors or warnings you encounter, and then repeat until you get to the latest API version.

When a component's LWC API version is set to 59.0 or later, it uses that value for its LWC framework version. Components that specify LWC API version 58.0 and earlier continue to work based on LWC framework behavior in Summer '23 (API 58.0). When you set a component to use an earlier API version, you don't get new features, bug fixes, and enhancements that are available only with later LWC API versions.

Use Complex Template Expressions in Your Lightning Web Components (Beta)

Add sophisticated presentation logic to your Lightning web component template files, and remove extra code from your component implementation. A component that renders a user interface can now use complex JavaScript expressions directly in its HTML template file. Use complex template expressions anywhere you use basic properties.

Use Complex Template Expressions in Your Lightning Web Components (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Add sophisticated presentation logic to your Lightning web component template files, and remove extra code from your component implementation. A component that renders a user interface can now use complex JavaScript expressions directly in its HTML template file. Use complex template expressions anywhere you use basic properties.

 **Note** Complex template expressions is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Where: This change applies to Lightning web components in Lightning Experience, Experience Builder sites, and all versions of the mobile app in all editions.

Why: One superpower of Lightning Web Components is the templating system, which uses the virtual DOM to render components intelligently and efficiently. Complex template expressions extends this capability to include a comprehensive subset of JavaScript expressions, enabling more dynamic and expressive templates while maintaining your components' performance characteristics and security model.

How: Complex template expressions can be used anywhere basic properties could previously be used. You must set the `apiVersion` of your component to 66.0 or later to enable complex template expressions for that component.

For documentation and examples, see the *Lightning Web Components Developer Guide*.

Display Consistent Empty State Illustrations With Theme Support (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the new `lightning-empty-state` component to add meaningful visuals and content to your components that show empty states. This component displays the latest Salesforce Lightning Design System (SLDS) empty state illustration and correctly sizes it for the container, simplifying your UI development. The SVG illustrations automatically adjust to the user's selected theme, and can adapt to dark mode in SLDS 2 themes, for a consistent look and feel across your app. The new `lightning-illustration` component displays the same set of illustrations without text.

Where: This feature applies to Lightning Experience. The component must run in a Salesforce org to display the illustrations.

Note The `lightning-empty-state` and `lightning-illustration` components are a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Why: Use the `lightning-empty-state` component wherever you expect a container to display data, such as records or tasks, but there's no data to populate it. There can be several reasons why there's no data, and now you can find just the right illustration to provide context and lighten the mood. The `lightning-empty-state` component also provides a title, description, and call-to-action buttons so you can provide more clarity or lead users to the next step of their journey. You can also depict an empty state without an illustration, title, or call-to-action button. Only the description is required.

How: Include the `<lightning-empty-state>` tag in your Lightning web component and pass the illustration name and title by using attributes. Pass the description and cta (call-to-action) by using slots.

See the illustration names and usage information in the [Lightning Component Reference](#) (can be outdated or unavailable during release preview). See the [SLDS 2](#) (can be outdated or unavailable during release preview) site for images of the illustrations and extensive information about the Empty State design.

This example shows an empty cart illustration along with a Browse Products call-to-action button with the brand variant.

```
<!-- myEmptyState.html -->
<!-- With illustration and action -->
<lightning-empty-state
  illustration-name="cart:noitems"
  title="It's looking a little empty in here">
  <p slot="description">Head to the product catalog to add something to your c
art.</p>
  <lightning-button
    variant="brand"
    label="Browse Products"
    slot="cta"
    onclick={handleCtaClick}>
  </lightning-button>
</lightning-empty-state>
```

The button handler in the component's JavaScript file carries out the action.

```
import { LightningElement } from "lwc";

export default class MyEmptyState extends LightningElement {
  handleCtaClick(event) {
    // go to the Products tab
  }
}
```

The same `myEmptyState` example component can run in both SLDS 1 and SLDS 2 themes. The `lightning-empty-state` component automatically detects the SLDS version of the theme and presents the correct version of the illustration.

In SLDS 2 themes, this component code produces this empty state depiction with an empty cart illustration.

It's looking a little empty in here

Head to the product catalog to add something to your cart.

[Browse Products](#)

For SLDS 1 themes, the same component produces this empty state depiction with a “gone fishing” illustration.

It's looking a little empty in here

Head to the product catalog to add something to your cart.

[Browse Products](#)

The `lightning-illustration` component can display the same empty state illustrations without descriptive text or buttons. We're working on more illustrations to use with this component.

This example component shows only the empty cart illustration in SLDS 2 themes and the gone fishing illustration in SLDS 1 themes.

```
<!-- myIllustration.html -->
<lightning-illustration
  illustration-name="cart:noitems"
  alternative-text="Shopping cart is empty">
</lightning-illustration>
```

Get Complete Type Definitions for Lightning Base Components

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Build your apps with confidence with the completion of the TypeScript rollout for all Lightning base components.

Where: This change applies to Lightning Experience, Experience Builder sites, and all versions of the mobile app in all editions.

How: When using a base component, import its type definition in your component. Type definitions for base components are available in the [@salesforce/lightning-types](#) Node Package Manager (npm) package.

If you have defined your own type definitions for base components, we recommend using the npm package in your LWC project instead.

See Also

[Lightning Web Components Developer Guide: TypeScript Type Definitions for LWC \(Developer Preview\)](#)

Improve Type Safety with the LWC TypeScript Converter MCP Tool (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use natural language prompts to automate the conversion of JavaScript files to TypeScript for LWC development.

Where: This change applies to Lightning Experience, Experience Builder sites, and all versions of the mobile app in all editions.

Note MCP Tools for LWC Development is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

How: The recommended way to use the LWC MCP tools is via Agentforce Vibes Extension. Agentforce Vibes is preconfigured with the Salesforce DX MCP Server (Beta). To enable the LWC MCP tools using other clients, such as Cursor or VS Code with Copilot, install the Salesforce DX MCP Server (Beta). The LWC TypeScript Converter MCP Tool is available as part of the `lwc-experts` toolset.

Update Your Custom Components for Use in Setup with Agentforce (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make your custom Aura and Lightning web components accessible to Agentforce in Setup by adding AI-related component and property descriptions to their `js-meta.xml` and `.design` files. AI component and property descriptions are used only in orgs that have Setup with Agentforce (beta) enabled.

Where: This feature is available in Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Foundations or Agentforce 1 editions.

Note Setup with Agentforce is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

When: This feature is available starting in early January 2026.

Why: When Setup with Agentforce is enabled, the Setup agent can recommend custom components when creating a Lightning record page from a user utterance. For the Setup agent to successfully analyze whether your custom component fits the requirements for it to be included on the suggested record page, the component must contain an AI-related description of what it does and descriptions of its properties.

How: For detailed instructions, see the [Lightning Web Components Developer Guide](#) or the [Lightning Aura Components Developer Guide](#).

See Also

[Streamline Administrative Tasks with Setup with Agentforce \(Beta\)](#)

Check For Errors From the Disconnected DOM Node Rehydration Fix

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To improve framework consistency, Lightning web components now rehydrate only when they're actively connected to the DOM. For example, rehydration skips detached nodes to prevent lifecycle methods like `renderedCallback` from firing multiple times. Previously, certain edge cases allowed disconnected DOM nodes to be rehydrated, which could trigger reactive state updates or function invocations on detached components.

Where: This change applies to Lightning Experience, Experience Builder sites, and all versions of the mobile app in all editions. This change also applies to Lightning web components in Open Source.

How: This change is enabled automatically. If your implementation created a dependency on the previous rehydration behavior, review your logic for breakages.

Manage Page Errors with Error Console

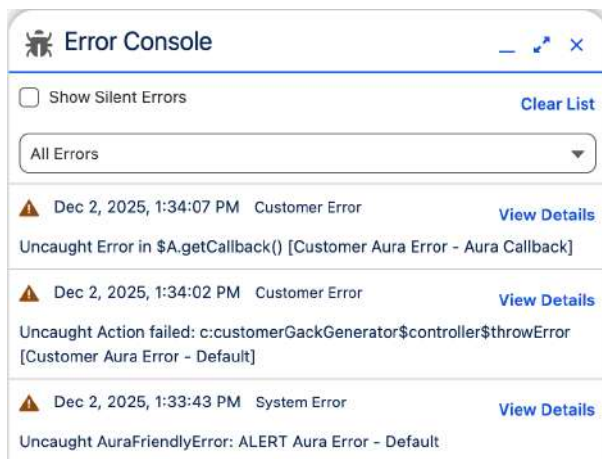

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enable the Error Console to capture and display component and page errors without interrupting your work in Salesforce. The console collects non-fatal errors so you can see them when it's convenient for you, and they don't require interaction. Fatal errors still show in modal error panels that you must dismiss before continuing. Fatal errors are also collected in the Error Console for later inspection.

Where: This change applies to Lightning Experience.

Why: The Error Console keeps non-fatal errors from interrupting your work, while making it easier to share error details with your Salesforce admin or developer.

How: From Setup, in the Quick Find box, enter *User Interface*, and then select **User Interface**. Enable the **Use Error Console for error reporting in Lightning Experience** option in the Advanced Settings section.

Do More with Lightning Out 2.0 Improvements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about improvements to Lightning Out 2.0 and the Lightning Out 2.0 App Manager.

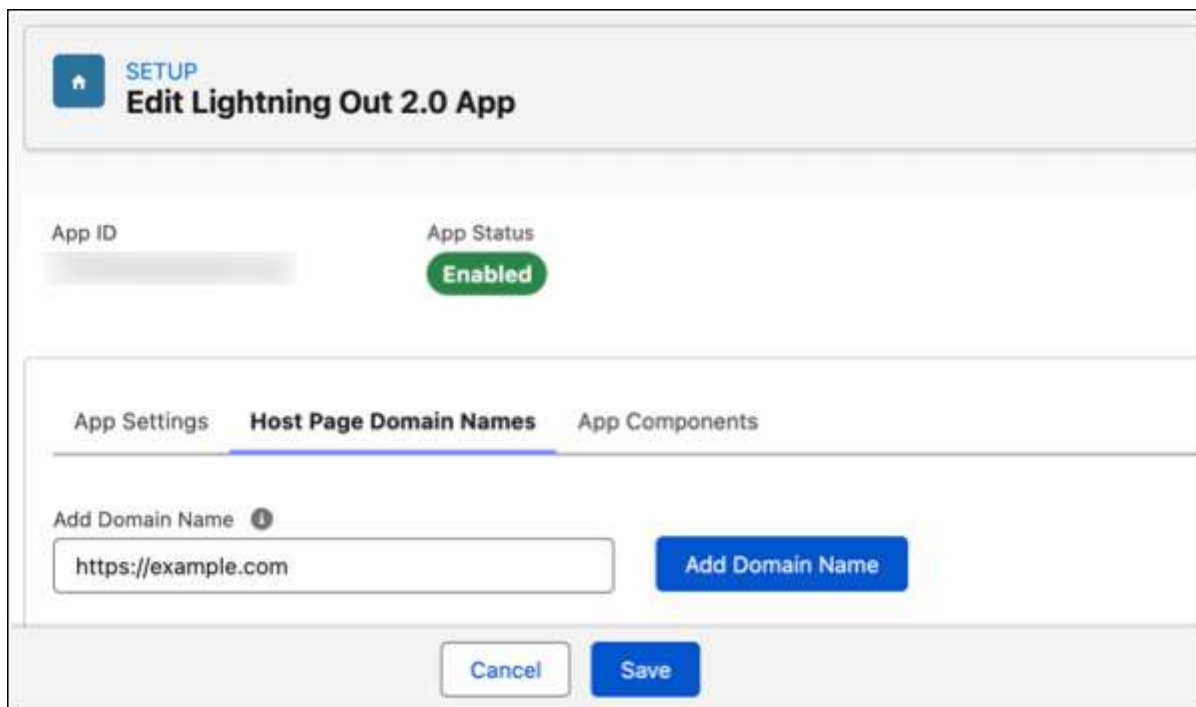

Where: This feature is available in Lightning Experience in Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: Lightning Out 2.0 includes these enhancements.

- In the Lightning Out 2.0 App Manager, you can now add the domain names of the external apps that host your Lightning Out 2.0 app. In Setup, also add the domain names to the Trusted Domains allowlist on the Session Settings page.
- In the Lightning Out 2.0 App Manager, you can now add Lightning web components (LWC) with complex namespaces, such as those with mixed casing. For example, `complexNs/lwcComponent` is an LWC component with a valid complex namespace.
- In the Lightning Out 2.0 App Manager, to separate the namespace from the component name, you can now use a forward slash (/) or a hyphen (-). If you use a hyphen, separate the segments of a complex namespace with an underscore (_). For example, `complexNs/lwcComponent` and `complex_ns-lwc-component` use equivalent, valid syntax.
- The Lightning Out 2.0 app component now supports the `app-id` attribute, which is the ID of the Lightning Out 2.0 app. The Lightning Out 2.0 app code block in the Lightning Out 2.0 App Manager automatically includes this attribute. Existing Lightning Out 2.0 apps don't require this attribute.

How:

To add the domain name of an external app, open the Host Page Domain Names tab and enter the name. This example shows the `https://example.com` domain name added to a Lightning Out 2.0 app.

To add an LWC component to a Lightning Out 2.0 app, open the App Components tab and enter the name. This example shows the `complexNs/lwcComponent` component added to a Lightning Out 2.0 app.

SETUP
Edit Lightning Out 2.0 App

App ID:

App Status: **Enabled**

App Settings Host Page Domain Names **App Components**

Add Component ⓘ

Add Component

Component Name	Custom Properties	Actions
1 complexNs/lwcComponent		X Remove

Cancel **Save**

Here's an example of a generated Lightning Out 2.0 code block that includes the `complexNs/lwcComponent` component. In the code block, Salesforce converts all components to the standard syntax for custom HTML elements. The generated code block doesn't include the `frontdoor_url` attribute on the `lightning-out-application` component because this attribute is set at run time.

```
<!-- Generated Lightning Out 2.0 App Code Block -->
<script
  type="text/javascript"
  async=""
  src="https://MyDomainName.my.salesforce.com/lightning/lightning.out.lates
t/index.iife.prod.js">
</script>
<lightning-out-application
  app-id="18-DigitSalesforceID"
  components="complex_ns-lwc-component">
</lightning-out-application>
<complex_ns-lwc-component></complex_ns-lwc-componenent>
```

Lightning Design System

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Salesforce Lightning Design System (SLDS) includes the resources to create user interfaces consistent with Salesforce Lightning principles, design language, and best practices.

Salesforce Lightning Design System Component Blueprints Updates

Get more out of SLDS component blueprints and utilities with these enhancements and bug fixes.

Use Dark Mode in More Editions (Beta)

You can now enable dark mode for Salesforce Lightning Design System 2 (SLDS 2) themes in Free Suite, Pro Suite, Professional, Enterprise, and Developer edition orgs. Previously, dark mode was available only for Salesforce Starter Suite orgs. Dark mode shows light-colored text and visual elements on a dark background, which lays the foundation for richer theming opportunities and more customization of Lightning base components. With dark mode enabled, your users can select an appearance that reduces eye strain in low-light conditions and enhances readability.

Salesforce Lightning Design System Component Blueprints Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get more out of SLDS component blueprints and utilities with these enhancements and bug fixes.

Where: These changes apply to Salesforce Lightning Design System (SLDS) and Lightning Experience.

How: Improve your user interface (UI) with these recent updates to SLDS component designs.

- To improve accessibility, we made a small color adjustment to the SLDS 1 theme Lightning Blue.
- We added two new component designs for empty state and illustration. Both are implemented as Lightning base components, `lightning-empty-state` and `lightning-illustration`, and they're available as beta features.
 - The empty state component is designed to show visuals that adapt to your brand, helpful messages, and guidance when there's no content to display.
 - The illustration component is designed to add visuals that adapt to your brand, and enhance

communication and engagement.

- The `lightning-illustration` component currently can display the same illustrations as `lightning-empty-state` without descriptive text or buttons. We're working on more illustrations to use with `lightning-illustration`.
- Depending on the SLDS version in your org, both the illustration and empty state components switch between SLDS 1 and SLDS 2 automatically. Additionally, SLDS 2 illustration and empty state colors are optimized for dark mode.

Note Empty state component, illustration component, and dark mode are a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of these pilot or beta services is at the Customer's sole discretion.

- To meet the Web Content Accessibility Guidelines (WCAG) 1.4.11 standard for non-text accessibility, we modified the root `::selection` pseudo-selector by removing the `background`, `text-shadow`, and `color` properties and values. These changes allow the user agent, or web browser, to control the styling of highlighted and selected content.

Use Dark Mode in More Editions (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

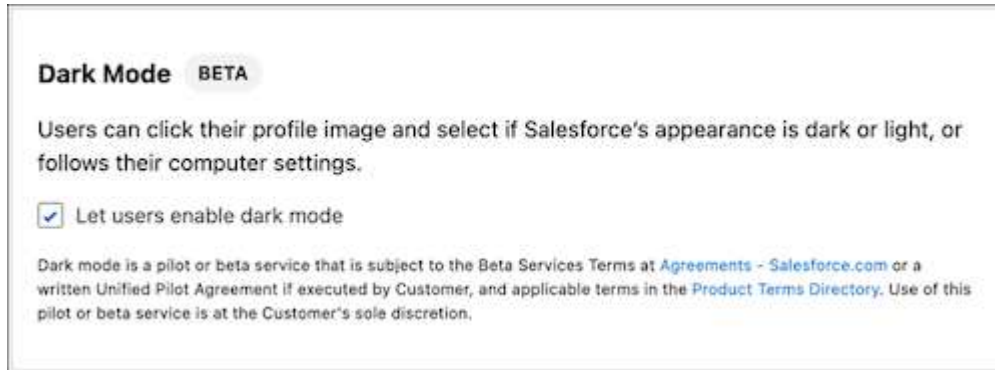

You can now enable dark mode for Salesforce Lightning Design System 2 (SLDS 2) themes in Free Suite, Pro Suite, Professional, Enterprise, and Developer edition orgs. Previously, dark mode was available only for Salesforce Starter Suite orgs. Dark mode shows light-colored text and visual elements on a dark background, which lays the foundation for richer theming opportunities and more customization of Lightning base components. With dark mode enabled, your users can select an appearance that reduces eye strain in low-light conditions and enhances readability.

Where: This change applies to Salesforce Lightning Design System 2 and Lightning Experience in Free Suite, Pro Suite, Professional, Enterprise, and Developer editions.

Note Dark mode is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

How: To enable dark mode, from Setup, in the Quick Find box, enter *Themes and Branding* and select it. Click **New Theme**, or click ▼ next to an existing SLDS 2 theme and then select **Edit**. In the Dark Mode section, select **Let users enable dark mode**.

Save your changes and then activate the theme.

After you enable dark mode, a user can click their profile image and select how they want Salesforce to appear.

Not all Salesforce apps are fully optimized for dark mode yet.

To share feedback about dark mode, see the [Trailblazer Community Design Trailblazers](#).

Visualforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Visualforce contains a release update in Spring '26, a continuation of an earlier release update.

For more information on features affected by these changes, refer to the [Visualforce Developer Guide](#).

[Escape the Label Attribute of <apex:inputField> Elements to Prevent Cross-Site Scripting in Visualforce Pages \(Release Update\)](#)

To prevent malicious code from executing in cross-site scripting (XSS) attacks on your Visualforce

pages, this release update escapes the label attribute of your `<apex:inputField>` tags. This update was first available in Winter '23.

Escape the Label Attribute of `<apex:inputField>` Elements to Prevent Cross-Site Scripting in Visualforce Pages (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To prevent malicious code from executing in cross-site scripting (XSS) attacks on your Visualforce pages, this release update escapes the label attribute of your `<apex:inputField>` tags. This update was first available in Winter '23.

Where: This change applies to Salesforce Classic and Lightning Experience in Professional, Enterprise, Performance, Unlimited, and Developer editions. Lightning console apps are available for an extra cost to users with Salesforce Platform user licenses for certain products. Some restrictions apply. For pricing details, contact your Salesforce account executive.

When: Salesforce enforced this update for most orgs in Spring '23. Salesforce enforces this update for all remaining orgs in Spring '26. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and then click the maintenance tab.

Why: This update improves the security of your Visualforce pages by automatically escaping the label attribute of all your existing `<apex:inputField>` elements. It also escapes the label attribute for `<apex:inputField>` elements that you create after enabling the update.

How: To review this release update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For **Escape the Label Attribute of `<apex:inputField>` Elements to Prevent Cross-Site Scripting in Visualforce Pages**, follow the testing and activation steps.

After this update is enforced, label attributes that you already escaped are double-escaped. Double-escaped attributes don't render correctly on Visualforce pages. For instructions on how to locate and fix double-escaped attributes, see the testing steps for this release update.

Apex

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Run only Apex tests that are relevant to a deployment by using the `RunRelevantTests` (beta) test level. Apex cursors and pagination cursors are enhanced and generally available. Extract picklist fields by using the `ConnectApi.RecordUi.getPicklistValuesByRecordType()` method. Exposing Apex REST and AuraEnabled controller methods as agent actions is generally available. The `Blob.toPdf()` method uses the same PDF rendering service as Visualforce. Prepare your Apex code for changes to sharing recalculation behavior. Filter Test Discovery API results by using the `category` query parameter. Specify the number of oldest, completed async jobs to delete by using the method overload for `purgeOldAsyncJobs()`.

For more information on these enhancements, see the [Apex Developer Guide](#) and the [Apex Reference Guide](#).

Deploy Apex Components Faster by Running Only Relevant Tests (Beta)

To reduce Apex component deployment time, use the new `RunRelevantTests` test level to run only the tests relevant to your code changes. This feature automatically determines which tests to run based on an analysis of the deployment payload and the payload dependencies. For fine-grained control, you can annotate test classes so that they either run regardless of the deployment payload, or run when specified components are new or modified. This targeted approach boosts the speed and reliability of your deployment while maintaining code quality and coverage requirements.

Use Apex Cursors for Expanded SOQL Query Result Support (Generally Available)

Use Apex cursors and pagination cursors to work with large SOQL query result sets in manageable parts. This feature, now generally available, includes enhancements since the beta release. Standard cursors, when combined with queueable Apex, address the limitations of batch Apex. Pagination cursors are designed for UI elements, such as multipage record lists. Both Apex cursor types can traverse forwards and backwards through result sets and can handle high-volume, high-resource processing.

Extract Picklist Values Based on Record Type

Get the values for all picklist fields for a particular record type by using the new

`ConnectApi.RecordUi.getPicklistValuesByRecordType(objectApiName, recordTypeId)` method. We delivered this feature due to your idea on IdeaExchange.

Expose Apex REST and AuraEnabled Controller Methods as Agent Actions (Generally Available)

Create agent actions based on Apex classes by annotating methods in those classes, generating an OpenAPI spec document, and deploying that document to your org. Manage the exposed methods as APIs in API Catalog. This feature is now generally available.

Use Visualforce PDF Rendering Service with Apex Blob.toPdf() (Release Update)

With this update enabled, the Apex `Blob.toPdf()` method for PDF rendering uses the same rendering service as Visualforce. The Visualforce PDF rendering service offers improvements such as additional fonts and multibyte character support. This change makes PDF rendering more consistent on the Salesforce Platform.

Review Apex Code for Changed Sharing Recalculation Behavior

To help you prepare your Apex code for changes to sharing recalculation behavior, Salesforce created a release update that walks you through identifying and fixing affected code. For more information, review the related release note and the Update Apex Code and Flows for Changed Sharing Recalculation Behavior release update in Setup.

Filter Test Discovery API Results by Test Category

To retrieve only flow tests or only Apex tests, use the new `category` query parameter in calls to the Test Discovery API endpoint. Previously, you could filter tests only by namespace prefix and test method visibility. Filtering by test category is helpful in orgs with large test suites across different namespaces.

Specify the Number of Async Jobs to Delete

Use the new method overload for `purgeOldAsyncJobs()` to specify the number of oldest, completed async jobs in your org to purge. Providing an upper bound for the number of records to delete enables incremental progress when large volumes of records are to be deleted.

See Also

[Apex: New and Changed Items](#)

Deploy Apex Components Faster by Running Only Relevant Tests (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To reduce Apex component deployment time, use the new `RunRelevantTests` test level to run only the tests relevant to your code changes. This feature automatically determines which tests to run based on an analysis of the deployment payload and the payload dependencies. For fine-grained control, you can annotate test classes so that they either run regardless of the deployment payload, or run when specified components are new or modified. This targeted approach boosts the speed and reliability of your deployment while maintaining code quality and coverage requirements.

Where: The `RunRelevantTests` test level is available in all API versions. The `@IsTest(critical=true)` and `@IsTest(testFor='...')` annotations are available in API version 66.0 and later. The feature is available in Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

Note The `RunRelevantTests` test level and the associated `@IsTest()` annotations are pilot or beta services that are subject to the Beta Services Terms at [Agreements – Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of these pilot or beta services are at the Customer's sole discretion.

Why: The new `RunRelevantTests` test level addresses the limitations of the existing

`RunLocalTests` and `RunSpecifiedTests` test levels. `RunLocalTests`, the default test level for Apex production deployments, runs all Apex tests in the org except the ones that originate from installed managed and unlocked packages. In orgs with extensive test suites, `RunLocalTests` can result in long deployment times even for small changes. In contrast, `RunRelevantTests` runs only Apex tests relevant to modified components in the deployment payload, so the number of tests that run scales proportionally to the deployment size. `RunRelevantTests` also addresses a drawback of the `RunSpecifiedTests` test level. With `RunSpecifiedTests`, you must manually determine which tests are applicable to the changes, which often requires custom DevOps tooling. In contrast, the `RunRelevantTests` test level engine analyzes the deployment payload and automatically runs a subset of tests based on that analysis.

How: To specify the `RunRelevantTests` test level when you deploy Apex components, use one of these methods.

- To deploy by using a [file-based call](#), set the `testLevel` field on the `DeployOptions` object to `RunRelevantTests`. Then pass `DeployOptions` as an argument to the `deploy()` method.
- To deploy by using the `deployRequest` REST resource, define a `deployOptions` object in the POST request body and set its `testLevel` field to `RunRelevantTests`.
- To deploy by using the Salesforce CLI, use the `sf project deploy start` command and set the `--test-level` flag to `RunRelevantTests`.

If a test class must always run regardless of the classes or triggers in the deployment payload, annotate the test class with `@IsTest(critical=true)`.

If a test class must always run whenever specified classes or triggers are new or changed in the deployment payload, annotate the test class with `@IsTest(testFor='ApexClass:ClassName, ApexTrigger:TriggerName')`.

Use Apex Cursors for Expanded SOQL Query Result Support (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Apex cursors and pagination cursors to work with large SOQL query result sets in manageable parts. This feature, now generally available, includes enhancements since the beta release. Standard cursors, when combined with queueable Apex, address the limitations of batch Apex. Pagination cursors are designed for UI elements, such as multipage record lists. Both Apex cursor types can traverse forwards and backwards through result sets and can handle high-volume, high-resource processing.

Where: This feature is available in API version 66.0 and later. The feature is available in Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

Why: Apex standard cursors offer an efficient alternative to batch Apex for processing large result sets. If you use an Apex batch job, you must set the batch size to the smallest value that stays within platform limits. The batch size is the same across the entire result set, so processing that result set can require an increased number of transactions. In contrast, using an Apex cursor with a chain of queueable jobs gives you flexibility in how many records are processed with each transaction. This approach provides better utilization of the asynchronous Apex limit. Calling `Cursor.fetch()` still counts against the SOQL query limit, and the rows fetched count against the SOQL query row limit.

How: This feature, now generally available, includes these enhancements.

- A `PaginationCursor` class to implement pagination in a UI. Calling the `PaginationCursor.fetchPage()` and `PaginationCursor.fetchDeleted()` methods count against the SOQL query limit, and the rows fetched count against the SOQL query row limit.
- Debug log events to track cursor operations.
- Updated cursor governance limits. The maximum cumulative number of new cursor rows per 24-hour period is 100 million.
- These new methods to track usage against new governor limits.
 - `Limits.getApexCursors()` and its upper bound `Limits.getLimitApexCursors()` method
 - `Limits.getApexPaginationCursors()` and its upper bound `Limits.getLimitApexPaginationCursors()` method
 - `Limits.getApexPaginationCursorRows()` and its upper bound `Limits.getLimitApexPaginationCursorRows()` method
- Cursor and pagination cursor support in AuraEnabled serialization and deserialization. You can serialize a cursor in an `@AuraEnabled` response and deserialize a cursor as an input parameter in an `@AuraEnabled` method.

Extract Picklist Values Based on Record Type

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get the values for all picklist fields for a particular record type by using the new

```
ConnectApi.RecordUi.getPicklistValuesByRecordType(objectApiName, recordTypeId)
```

method. We delivered this feature due to your idea on IdeaExchange.

Where: The feature is available in Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

Why: Previously, in Apex, you couldn't directly get picklist values that were specific to a record type without making callouts.

How: This method is especially useful for getting dependent picklist values. For example, if an object has a tree of dependent picklists, such as `Continents__c`, `Countries__c`, `Cities__c`, use this method to get all the values for each picklist in one request via the

```
ConnectApi.PicklistValuesCollection.
```

Expose Apex REST and AuraEnabled Controller Methods as Agent Actions (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create agent actions based on Apex classes by annotating methods in those classes, generating an OpenAPI spec document, and deploying that document to your org. Manage the exposed methods as APIs in API Catalog. This feature is now generally available.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

[Agentforce Developer Guide: Build and Enhance Agentforce Actions](#)

[Salesforce Help: Bring Apex APIs into API Catalog \(can be outdated or unavailable during release\)](#)

[preview](#))

Use Visualforce PDF Rendering Service with Apex `Blob.toPdf()` (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With this update enabled, the Apex `Blob.toPdf()` method for PDF rendering uses the same rendering service as Visualforce. The Visualforce PDF rendering service offers improvements such as additional fonts and multibyte character support. This change makes PDF rendering more consistent on the Salesforce Platform.

Where: This feature is available in Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

When: Salesforce enforces this update in Summer '26. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the **Maintenance** tab.

How: To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Use Visualforce PDF Rendering Service with Apex `Blob.toPdf()`, follow the testing and activation steps.

With this update enabled, calls to `Blob.toPdf()` automatically use the Visualforce PDF rendering service. `Blob.toPdf()` still accepts any string as an argument, and still returns a `Blob` result. Other than using a different PDF rendering engine, the shape of `Blob.toPdf()` is unchanged.

 **Important** The Visualforce PDF rendering service offers an expanded range of fonts, and the default font is changed from `serif` to `sans-serif`. If your PDF string doesn't include explicit font styling, this change might result in different line lengths, and different line and page breaks for PDFs rendered compared to the old service. See [Fonts Available When Using Visualforce PDF Rendering](#) for additional details.

For more details on the features and limitations of the Visualforce PDF rendering service, see [Render a Visualforce Page as a PDF File](#) in the *Visualforce Developer Guide*.

Review Apex Code for Changed Sharing Recalculation Behavior

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To help you prepare your Apex code for changes to sharing recalculation behavior, Salesforce created a release update that walks you through identifying and fixing affected code. For more information, review the related release note and the [Update Apex Code and Flows for Changed Sharing Recalculation Behavior](#) release update in Setup.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional, Enterprise, Performance, Unlimited, and Developer editions.

See Also

[Update Apex Code and Flows for Changed Sharing Recalculation Behavior \(Release Update\)](#)

Filter Test Discovery API Results by Test Category

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To retrieve only flow tests or only Apex tests, use the new `category` query parameter in calls to the Test Discovery API endpoint. Previously, you could filter tests only by namespace prefix and test method visibility. Filtering by test category is helpful in orgs with large test suites across different namespaces.

Where: This feature is available in API version 66.0 and later. This feature is available in Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

How: To retrieve tests in a specific test category, make a GET request to the Test Discovery API endpoint, which is a Tooling API resource. Set the `category` query parameter to either `flow` or `apex`. For example, this call returns only Apex tests.

```
https://MyDomain.my.salesforce.com/services/data/v66.0/tooling/tests?category=apex
```

You can't specify multiple categories in the same call. However, you can combine the `category` query parameter with other query parameters. For example, this call returns only automated flow tests from the `ourManagedPackage` namespace.

```
https://MyDomain.my.salesforce.com/services/data/v66.0/tooling/tests?category=flow&namespacePrefix=ourManagedPackage
```

Specify the Number of Async Jobs to Delete

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the new method overload for `purgeOldAsyncJobs()` to specify the number of oldest, completed async jobs in your org to purge. Providing an upper bound for the number of records to delete enables incremental progress when large volumes of records are to be deleted.

Where: This feature is available in API version 66.0 and later. This feature is available in Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

How: Specify the number of completed async jobs to delete, starting from the oldest jobs that finished before the specified date. This example shows how to delete up to 1000 job records for jobs that finished before today's date.

```
Integer maximumNumberOfJobsToDelete = 1000;
Integer count = System.purgeOldAsyncJobs(
    Date.today(),
    maximumNumberOfJobsToDelete
);
System.debug('Deleted ' + count + ' old jobs.');
```

See Also

[Apex Reference Guide: purgeOldAsyncJobs\(dt, numOfJobs\)](#)

API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about improvements, new capabilities, and important announcements in API version 66.0.

Expose Custom SOQL in REST API Calls Using Named Query API (General Availability)

Use Named Query API to define and expose custom SOQL queries, or Named Query APIs, as scalable actions for REST API clients. Named Query APIs can retrieve data quickly and more efficiently than existing Flow or Apex processes.

Update Instanced URLs in API Traffic (Release Update)

To prevent disruption when Salesforce ends support for API traffic that uses an incorrect instanced URL, make sure that API traffic to your org uses the org's My Domain login URL. First available in Summer '25, this release update was scheduled to be enforced in Spring '26, but we postponed the enforcement to Summer '26.

EventBusSubscriber Object's Position and Tip Fields Are Being Deprecated

The EventBusSubscriber object's Position and Tip fields are being deprecated. They are being replaced with the new fields LastProcessed and LastPublished. The field type is changing from int to string in order to handle large replay IDs. We recommend updating your code to use LastProcessed and LastPublished to avoid issues when the replay ID exceeds the maximum integer size.

Sending Session IDs in Outbound Messages Is Being Removed

To align with modern security best practices, you can no longer send session IDs in outbound messages starting February 16, 2026. Instead, use OAuth to authenticate. When this change goes into effect, the new outbound message form will not include the option to send a session ID, the IncludeSessionId flag in the API will be ignored and set to FALSE, and the <sessionId></sessionId> element of an outbound message payload won't include a session ID.

Metadata Deployments and Retrievals Have New Limits

To maintain predictable performance, we're now applying limits to the volume of metadata deployed and retrieved for four specific metadata types: AIAuthoringBundle, AnalyticsDashboard, AnalyticsWorkspace, and AnalyticsVisualization. These limits restrict the number of metadata components allowed within a single package zip file, and the total number of deployments or retrievals permitted within a 24-hour period.

Data 360 SOQL Query Results Are Limited to 12-MB at a Time

To prevent large queries from crashing the app server, Data 360 limits Salesforce Object Query Language (SOQL) results to 12-MB. SOQL returns the results up to the size limit with a query more link to paginate through the rest of the results. If a single query result exceeds the size limit, SOQL rejects the query and you can't retrieve the results.

SOAP API login() Call in SOAP API Versions 31.0 Through 64.0 Is Being Retired (Release Update)

In Summer '27, the SOAP API `login()` call in SOAP API versions 31.0 through 64.0 will no longer be supported and no longer be available.

Expose Custom SOQL in REST API Calls Using Named Query API (General Availability)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Named Query API to define and expose custom SOQL queries, or Named Query APIs, as scalable actions for REST API clients. Named Query APIs can retrieve data quickly and more efficiently than existing Flow or Apex processes.

Note Using Named Query APIs as agent actions remains a beta feature that must be enabled in Setup. Use of this beta feature is available for an additional cost. Required add-on licenses vary by agent type. Setup for AI agents is available on the desktop site.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Update Instanced URLs in API Traffic (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To prevent disruption when Salesforce ends support for API traffic that uses an incorrect instanced URL, make sure that API traffic to your org uses the org's My Domain login URL. First available in Summer '25, this release update was scheduled to be enforced in Spring '26, but we postponed the enforcement to Summer '26.

Where: This change applies to Lightning Experience and Salesforce Classic in all editions except Database.com.

When: Salesforce enforces this update on a rolling basis shortly after Summer '26 deployment.

If you enable this change before the related known issue is resolved, SOAP login URLs via Visualforce pages can return a 400 Bad Request error. We expect to resolve that issue in January 2026, so we recommend testing this change starting in early February 2026.

To get notified when that issue is resolved and when the specific rollout dates are available, join the [My Domain and Enhanced Domains](#) Trailblazer Community Group.

Why: Salesforce is decommissioning the service that supports hard-coded references to an incorrect instance name in API application traffic routing. This approach helps make sure that integrations continue to function smoothly while improving security, because My Domain URLs are unique to each org.

How: To test this change, from Setup, in the Quick Find box, enter *My Domain*, and then select **My Domain**. Under Redirections, enable **Block API traffic that uses an incorrect instanced URL**.

To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Update Instanced URLs in API Traffic, follow the testing and activation steps.

Note The release update states that API traffic that uses an incorrect instanced URL is blocked automatically in sandboxes. That information is no longer accurate. We recommend that you test this change via the My Domain setting.

EventBusSubscriber Object's Position and Tip Fields Are Being Deprecated

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The EventBusSubscriber object's Position and Tip fields are being deprecated. They are being replaced with the new fields LastProcessed and LastPublished. The field type is changing from int to string in order to handle large replay IDs. We recommend updating your code to use LastProcessed and LastPublished to avoid issues when the replay ID exceeds the maximum integer size.

Where: This change is available in Developer, Enterprise, Performance, and Unlimited editions.

Sending Session IDs in Outbound Messages Is Being Removed

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To align with modern security best practices, you can no longer send session IDs in outbound messages starting February 16, 2026. Instead, use OAuth to authenticate. When this change goes into effect, the new outbound message form will not include the option to send a session ID, the IncludeSessionId flag in the API will be ignored and set to FALSE, and the <sessionId></sessionId> element of an outbound message payload won't include a session ID.

Where: This change applies to Developer, Enterprise, Performance, and Unlimited editions.

When: The week of February 16, 2026.

How: Follow the guidance in [Authorize Apps with OAuth](#) instead of using a session ID.

Metadata Deployments and Retrievals Have New Limits

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To maintain predictable performance, we're now applying limits to the volume of metadata deployed and retrieved for four specific metadata types: AIAuthoringBundle, AnalyticsDashboard, AnalyticsWorkspace, and AnalyticsVisualization. These limits restrict the number of metadata components allowed within a single package zip file, and the total number of deployments or retrievals permitted within a 24-hour period.

Where: This change applies to all Salesforce editions.

Data 360 SOQL Query Results Are Limited to 12-MB at a Time

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To prevent large queries from crashing the app server, Data 360 limits Salesforce Object Query Language (SOQL) results to 12-MB. SOQL returns the results up to the size limit with a query more link to paginate through the rest of the results. If a single query result exceeds the size limit, SOQL rejects the query and you can't retrieve the results.

Where: This change applies to Developer, Enterprise, Performance, and Unlimited editions.

SOAP API login() Call in SOAP API Versions 31.0 Through 64.0 Is Being Retired (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

In Summer '27, the SOAP API `login()` call in SOAP API versions 31.0 through 64.0 will no longer be supported and no longer be available.

Where: This change affects these SOAP API versions:

31.0, 32.0, 33.0, 34.0, 35.0, 36.0, 37.0, 38.0, 39.0, 40.0, 41.0, 42.0, 43.0, 44.0, 45.0, 46.0, 47.0, 48.0, 49.0, 50.0, 51.0, 52.0, 53.0, 54.0, 55.0, 56.0, 57.0, 58.0, 59.0, 60.0, 61.0, 62.0, 63.0, 64.0

This change applies to Salesforce Classic and Lightning Experience in all API-enabled Professional, Enterprise, Performance, Unlimited, and Developer editions.

When: You can continue to use login() in SOAP API versions 31.0 through 64.0 until Summer '27 is released. At that time, login() in these SOAP API versions will be retired and unavailable. When login() in these SOAP API versions is retired, applications using login() in these SOAP API versions will experience disruption. The requests will fail with an error message indicating that the login() endpoint has been deactivated.

How: Before Summer '27 is released, customers and partners must modify or upgrade their applications to use external client apps for authentication. See [SOAP API login\(\) Retirement](#).

Test the retirement's impact on your org by enabling the test run in release updates. The test run disables the SOAP API login() call in your org.

Packaging

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Packaging facilitates the development and distribution of business apps. Use second-generation managed packages to create apps to sell and distribute on AppExchange. Use unlocked packages to develop internal business apps.

Recommend a Package Version to Your Subscribers

You can now encourage your subscribers to upgrade to a specific version of a package by setting a recommended version. When you set a package version as the recommended version, your subscribers see an **Upgrade to Recommended Version** option on the Installed Packages page in their org. Only released package versions can be the recommended version.

Troubleshoot Subscriber Issues Faster by Enabling Debug Logs

You can now self-serve enabling your access to a subscriber's Apex debug logs by using the License Management App (LMA). Use debug logs to troubleshoot issues that are specific to the subscriber. Previously, access to a subscriber's debug logs could only be granted by a subscriber's system admin or Salesforce Partner Support.

Recommend a Package Version to Your Subscribers

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now encourage your subscribers to upgrade to a specific version of a package by setting a recommended version. When you set a package version as the recommended version, your subscribers see an **Upgrade to Recommended Version** option on the Installed Packages page in their org. Only released package versions can be the recommended version.

Where: This change applies to second-generation managed packaging.

How: Promote a package version to the released state. Run the `sf package update` CLI command and specify the version in the `--recommended-version-id` flag. If a subscriber has a package version installed in their org that's lower than the version you set for the `--recommended-version-id` flag,

the subscriber sees the **Upgrade to Recommended Version** option on the Installed Packages page.

Installed Packages			
Action	Package Name	Publisher	Version Number
Uninstall Upgrade to Recommended Version	Example2GP	Salesforce	0.1

See Also

[Second-Generation Managed Packaging Developer Guide: Recommend a Specific Package Version to Your Subscribers](#)

Troubleshoot Subscriber Issues Faster by Enabling Debug Logs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now self-serve enabling your access to a subscriber's Apex debug logs by using the License Management App (LMA). Use debug logs to troubleshoot issues that are specific to the subscriber. Previously, access to a subscriber's debug logs could only be granted by a subscriber's system admin or Salesforce Partner Support.

Where: This change applies to first- and second-generation (2GP) managed packages.

How: In the LMA, find the subscriber's org, then enable debug logs for the package namespace.

Important You enable debug logs for all managed packages in the namespace, rather than for individual managed packages. When you enable debug logs for a namespace, the Apex code across managed packages in the namespace becomes visible to the subscriber org. Because multiple packages can share a namespace in 2GP, enabling debug logs for 2GP means enabling logs for all managed packages in the namespace.

We've optimized the record loading and transformation so Data Mask jobs complete faster. When it completes a job, Data Mask now bypasses automation rather than deactivating or reactivating when a job is complete. Data Mask deletes field-history tracking instead of turning it off for the masking process. Serial mode is removed as jobs automatically retry records when row-locked.

Where: This change applies to Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions where Data Mask is installed.

Who: This change is available to customers who want to install the latest managed package.

Monitor Sandbox Copy Progress in Greater Detail with an Updated UI

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The updated UI for sandbox copies and refreshes now provides a detailed visual progress bar and real-time status updates for each stage. Users gain greater insight and transparency into the process, enabling better tracking of sandbox progress and completion.

Where: This change applies to Salesforce Lightning Experience in Enterprise, Performance, and Unlimited editions.

When: The new UI is available now and active by default. Users can still temporarily revert to the old UI in Dev Hub Settings. This override will be available until the Summer '26 release.

Who: To create, refresh, activate, and delete a sandbox, you need the Manage Dev Sandbox (Developer or Developer Pro only) or Manage Sandboxes (all sandbox types) user permission.

How: From Setup, enter Sandboxes in the Quick Find box, then select Sandboxes. The new UI includes a visual progress bar indicating the current stage and an expandable section with helpful details for each stage of the process. After the copy completes, the visual progress bar changes to an indicator for when your next refresh will become available.

Platform Development Tools

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

Build applications collaboratively and deliver continuously with Salesforce Developer Experience (DX), the open and integrated experience for custom app development on Salesforce.

Agentforce DX

Create, preview, and test agents directly in a Salesforce DX project with Agentforce DX's pro-code tools, such as Salesforce CLI and VS Code.

Salesforce DX MCP Server

The Salesforce DX MCP Server is a specialized Model Context Protocol (MCP) implementation designed to facilitate interaction between LLMs and Salesforce orgs. Use the DX MCP Server and its tools to enter natural language prompts in your IDE to execute standard DX tasks, such as syncing metadata, running Apex and agent tests, and creating scratch orgs.

Salesforce CLI

Use Salesforce CLI to create environments for development and testing, synchronize source code, run tests, and control your application lifecycle.

Salesforce Extensions for Visual Studio Code

The Salesforce Extension pack includes tools for developing on the Salesforce platform in the lightweight, extensible VS Code editor. These tools provide features for working with development orgs (scratch orgs, sandboxes, and DE orgs), Apex, Lightning web components, Aura components, and Visualforce.

Agentforce Vibes IDE

Agentforce Vibes IDE is a web-based integrated development environment that has all the power and flexibility of Visual Studio Code, Salesforce Extensions for VS Code, and Salesforce CLI in your web browser.

Agentforce Vibes Extension

Agentforce Vibes Extension is an AI-powered developer tool that's available as a Visual Studio Code extension in VS Code desktop and Agentforce Vibes IDE. Agentforce Vibes Extension is built with the SFR model, a secure and custom AI model from Salesforce.

Scalability

Optimize and test your implementations. Troubleshoot errors, identify issues with application performance, and improve how you scale.

Agentforce DX

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create, preview, and test agents directly in a Salesforce DX project with Agentforce DX's pro-code tools,

such as Salesforce CLI and VS Code.

We release updates to Agentforce DX as needed. For the latest information, refer to the weekly [Salesforce CLI release notes](#), which include announcements about changes to Agentforce DX CLI commands.

Build Enterprise-Ready Agents with Agentforce DX and Agent Script (Beta)

Use pro-code tools, such as VS Code and Salesforce CLI, to build hybrid reasoning Salesforce agents. These new types of agents have both the predictability that your business demands and the creativity that large language models (LLMs) make possible.

Build Enterprise-Ready Agents with Agentforce DX and Agent Script (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use pro-code tools, such as VS Code and Salesforce CLI, to build hybrid reasoning Salesforce agents. These new types of agents have both the predictability that your business demands and the creativity that large language models (LLMs) make possible.

Where: These new features are available in Salesforce CLI version 2.115.15 and Agentforce VS Code Extension version 1.6.0.

Note This feature is a beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

What: Agentforce DX helps pro-code developers build these agents by minimizing context switching, enabling professional DevOps, and simplifying collaboration between low-code and pro-code developers. This release contains these new beta features:

- Author agents by using Agent Script, the language for building Salesforce hybrid reasoning agents. Agent Script combines the flexibility of natural language for code generation with the reliability of programmatic expressions for handling business rules.
- Easily edit Agent Script files in the VS Code editor with the new Agent Script VS Code extension, which provides standard code editing features: syntax highlighting, visual syntax cues (such as red squiggles for errors), internal validation, and outline support.
- Preview an agent conversation from its Agent Script file with the updated Agentforce DX VS Code Extension. With preview, you get behind-the-scenes details of how your agent is working. The preview supports two modes: simulated (which uses mocked actions) and live mode (which uses real Apex classes, flows, and other resources).

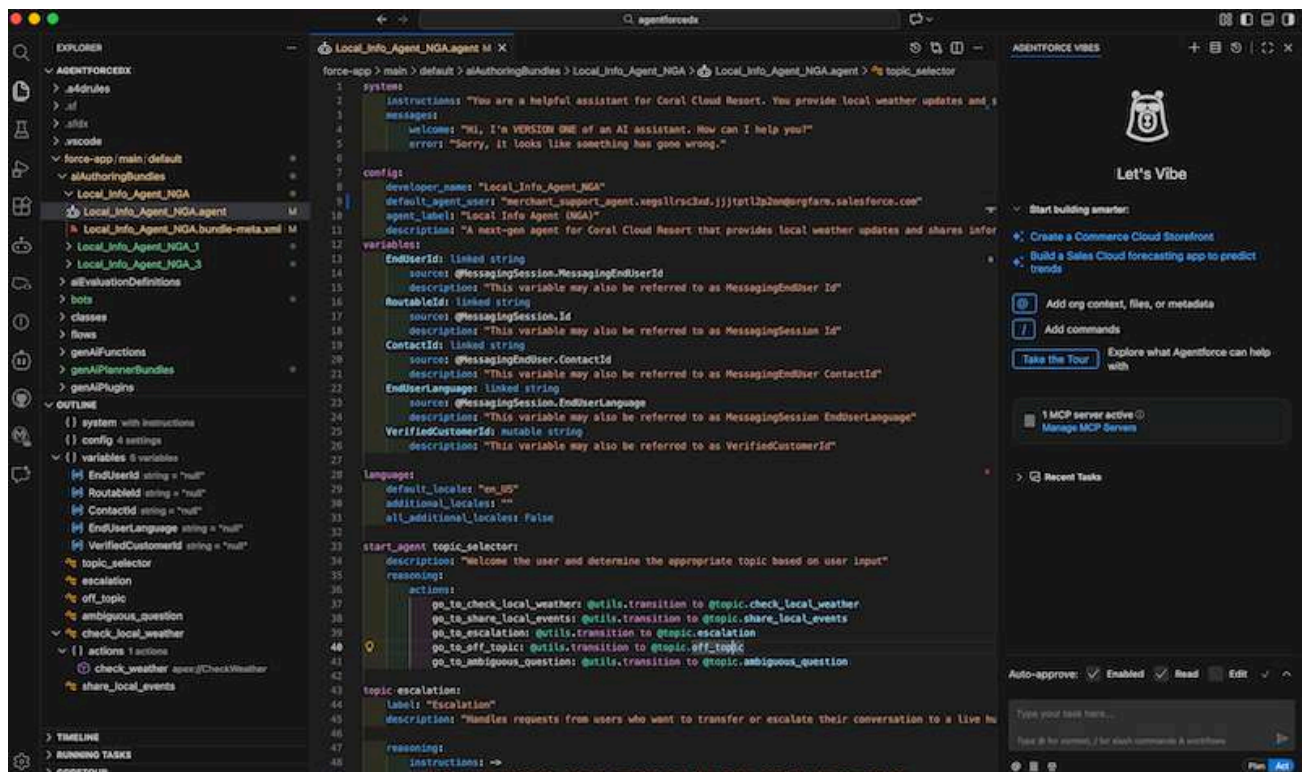

- Generate, validate, preview, and publish an authoring bundle with these new CLI commands. An authoring bundle is a new metadata type (**AiAuthoringBundle**) that represents an agent that uses Agent Script as its blueprint.
 - agent generate authoring-bundle** : Generate an authoring bundle from an existing agent spec YAML file.
 - agent validate authoring-bundle** : Validate an authoring bundle to make sure that its Agent Script file compiles successfully and you can use it to publish an agent.
 - agent publish authoring-bundle** : Publish an authoring bundle to your org, which results in a new agent or a new version of an existing agent.
 - agent preview** : Interact with an agent to preview how it responds to your statements, questions, and commands (utterances).

Agentforce DX is the pro-code equivalent of the newly released Agentforce Builder UI that runs in your org.

How: In general, you can use either a CLI or VS Code command to accomplish most of the tasks of authoring an agent. This example shows how to use a CLI command to generate an authoring bundle from an agent spec YAML file. The equivalent VS Code command is **AFDX: Generate an Agent**.

```
sf agent generate authoring-bundle --spec specs/agentSpec.yaml --name "Local Info Agent NGA" --target-org my-org
```

Then use the VS Code editor to customize the agent by coding its Agent Script file, which is the agent's blueprint. You can also vibe code the Agent Script file by using Agentforce Vibes.

Test the agent interactively by having a simulated conversation with it in the VS Code agent preview panel. You can also use the `agent preview` CLI command.

When you're ready to publish your agent to your org, you can use this CLI command or the **AFDX: Publish This Agent** VS Code command.

```
sf agent publish authoring-bundle --target-org my-org
```

Salesforce CLI

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Salesforce CLI to create environments for development and testing, synchronize source code, run tests, and control your application lifecycle.

We release new versions of Salesforce CLI weekly. Read the weekly release notes to learn about [recent updates](#).

Keep Up with the Latest Salesforce CLI Enhancements

Stay up to date with recent Salesforce CLI enhancements.

Keep Up with the Latest Salesforce CLI Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Stay up to date with recent Salesforce CLI enhancements.

Where: These changes apply to Salesforce CLI version 2.104.6 and later.

How: Read the [Salesforce CLI weekly release notes](#) for detailed information about all the new and changed features and issue fixes in recent releases.

Improve Deploy Performance by Running Only Relevant Apex Tests

Run only relevant Apex tests when you deploy metadata to your org. Use the new `RunRelevantTests` value of the `--test-level` flag of the `project deploy start|validate` commands. You can also use the same flag with the `project delete source` command.

Salesforce automatically identifies the relevant tests based on an analysis of the deployment payload and the payload dependencies.

This example deploys source files in the `force-app` package directory to the org with the alias `my-scratch` and runs only relevant Apex tests:

```
sf project deploy start --source-dir force-app --test-level RunRelevantTests
--target-org my-scratch
```

Run Apex and Flow Tests with a Single CLI Command (Beta)

Note This feature is a beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Ensure interoperability between Apex classes and flows by running their tests in a single and unified way with these new CLI commands:

- `logic run test` : Run tests for Apex and Flows in an org.
- `logic get test` : Get the results of an async test run, or if it timed out.

Many flags of these new commands mimic the flags for the existing `apex run|get test` and `flow run|get test` commands, such as `--tests`, `--test-level`, `--code-coverage`, `--class-names`, and `--output-dir`. But the new `logic run test` command expands the `--tests` flag so that you can specify both Apex and flow tests and adds a `--test-category` flag to narrow the type of

tests you want to run.

By default, the logic run test command runs asynchronously and returns a test run ID. Then use the `logic get test` command to retrieve the results.

This example runs all local Apex and flow tests in the org with the alias `my-scratch` asynchronously:

```
sf logic run test --test-level RunLocalTests --test-category Apex --test-category Flow --target-org my-scratch
```

The command returns a test run ID that you pass to the `logic get test` command to get the test results:

```
sf logic get test --test-run-id <test-run-id>
```

Retrieve Package Metadata for a Specified Package Version

You can retrieve package metadata for only second-generation managed package versions or unlocked packages.

This example shows how to retrieve package metadata for a converted subscriber package version ID (starts with 04t) into `my-directory` in your Salesforce DX project directory:

```
sf package version retrieve --package 04tXXX --output-dir my-directory --target-dev-hub devhub@example.com
```

Customize the Timeout When Attempting to Log Into an Org

If you try to authorize an org with the `org login web` CLI command, and it runs into an issue, the CLI command now times out after 2 minutes, rather than hanging indefinitely. Customize the number of milliseconds that the command waits to time out with the new `SF_WEB_OAUTH_SERVER_TIMEOUT` environment variable. The default value is `120000` (2 minutes).

This example sets the timeout to 3 minutes:

```
export SF_WEB_OAUTH_SERVER_TIMEOUT=180000
```

Customize the Apex Test Polling Interval

Specify the number of seconds to poll the org to check for the test status when you run `apex test run` with the new `--poll-interval` flag. Previously the poll interval was hard-coded to 1 second. This example shows how to set the poll interval to 5 seconds:

```
sf apex run test --class-names MyClassTest --result-format human --poll-interval 5 --target-org my-org
```

Scalability

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Optimize and test your implementations. Troubleshoot errors, identify issues with application performance, and improve how you scale.

[Plan and Peak Load Test with Scale Test](#)

Use the Test Reports tab on the Test Execution page to see how your test performed. View important takeaways about Requests per Second (RPS), throttles, and governor limits. On the New Booking page, enter inputs for trial runs, including date, time, and the anticipated size of the final test.

[Deploy Scalable Apps with Scale Center](#)

Generate on-demand insights. Use the Lightning Experience Insights (Beta) page to get insights about Experienced Page Time (EPT) and slow pages. Use Database Insights to improve SOQL performance. The Org Overview page gives you weekly insights about errors during peak hours.

Optimize Pages with Lightning Experience Insights (Generally Available)

Analyze performance trends and improve slow pages, components, and actions using Lightning Experience Insights. This feature, now generally available, includes some changes since the beta release. Now, you can generate these insights for production orgs with low page views and for all sandbox orgs. The Key Insights section includes new settings to improve org performance. Finally, the new format and documentation of the High Impact, Slow Performing Pages table make critical insights easier to understand.

Optimize Code with ApexGuru

ApexGuru is now available in Salesforce Code Analyzer for VS Code and Code Builder, offering inline visibility into performance hotspots while writing Apex. Scan Apex classes directly in the IDE, receiving inline recommendations with context and severity.

Plan and Peak Load Test with Scale Test

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the Test Reports tab on the Test Execution page to see how your test performed. View important takeaways about Requests per Second (RPS), throttles, and governor limits. On the New Booking page, enter inputs for trial runs, including date, time, and the anticipated size of the final test.

Where: This change applies to Lightning Experience in all editions. Scale Test is available for customers with a Full sandbox in all Hyperforce regions, except Singapore. To get access, contact your customer success representative or account executive.

How: From Setup, in the Quick Find box, enter *Scale*, then click **Scale Test**.

Deploy Scalable Apps with Scale Center

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Generate on-demand insights. Use the Lightning Experience Insights (Beta) page to get insights about Experienced Page Time (EPT) and slow pages. Use Database Insights to improve SOQL performance. The Org Overview page gives you weekly insights about errors during peak hours.

Where: Scale Center is available at no additional cost for all major editions in Production and Full sandbox environments. All Signature, Scale Test, and Partner Large Data Volume (LDV) orgs have access. You can turn on Scale Center for five Standard (non-SysAdmin) users per org. Scale Center is now available in Government Cloud Plus.

How: From Setup, in the Quick Find box, enter *Scale*, then click **Scale Center**.

Optimize Pages with Lightning Experience Insights (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Build UI easily with these new and changed resources.

New and Changed Lightning Web Components

Build UI easily with these new and changed components.

New and Changed Modules for Lightning Web Components

These modules have changes.

New and Changed Directives for Lightning Web Components

Add dynamic behavior to an HTML template with directives.

Changed Aura Components

These components have changes.

Changed Aura Component Events

The following event has changes.

New and Changed Lightning Web Components

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Build UI easily with these new and changed components.

New Components

The following components are new.

lightning-empty-state (Beta)

Adds meaningful visuals and content to your components that show empty states. For more information, see [Display Consistent Empty State Illustrations With Theme Support \(Beta\)](#).

lightning-illustration (Beta)

Displays empty state illustrations without descriptive text or buttons. For more information, see [Display Consistent Empty State Illustrations With Theme Support \(Beta\)](#).

Changed Lightning Web Components

These components have changed.

lightning-combobox

This component now correctly participates in validation and form submissions, so the browser can set focus on the component when it contains an invalid value and the form is validated on submission.

lightning-datatable

The height of the table container has been reduced by 3rem to display the horizontal scrollbar when the status bar is present, such as when data is changed in a cell during inline editing.

These accessibility behaviors are new.

- When you specify `displayReadOnlyIcon: true` and `editable:false`, the lock icon now displays inside a `<span>` element that contains `aria-label="Locked Column Name"` and `role="image"`, where `Column Name` refers to the label that you define for the column.
- The `<span>` element that contains assistive text for the lock icon has been removed.

lightning-flexcard

This attribute is new.

- `lwr` –Determines whether the component is compatible with Lightning Web Runtime (LWR) sites. Set this parameter to `true` if you want to embed your Flexcard on an LWR site.

lightning-input

The calendar on the input fields of type `date` and `datetime` have these accessibility changes.

- The `<select>` element for month and year selections now specify the `aria-describedby` attribute. The `<div>` element that specifies `role="status"` contains an empty `<div>` element. When a field-level error occurs, the element renders assistive text for screen readers.
- The `tabindex` attribute has been moved from the `<td>` elements on the calendar to the day buttons, which are inner `<span>` elements that specify `role="button"`.
- The `aria-selected`, `aria-current`, and `aria-disabled` attributes have been moved to the inner `<span>` element that specifies `role="button"`.
- The `aria-label` attribute has been added to the `<span>` element that specifies `role="button"`, which indicates `day month year, button`. For example: `8 October 2025, button`, depending on the screen reader.

Required fields of type `checkbox`, `date`, `datetime`, `time`, and `file` have these accessibility changes.

- The `<abbr>` element specifies `aria-hidden="true"`.

lightning-input-address

If the Geolocation API times out after 10 seconds, the address lookup field defaults to San Francisco, CA with a latitude of 37.790091 and longitude of -122.396848 instead of your current position. A timeout can occur due to factors such as browser security settings, network conditions, and device capabilities.

lightning-input-field

The calendar on the input field of type `date` and `datetime` has the same accessibility changes as those for `lightning-input`.

lightning-input-rich-text

The default font size is now 13, which you can also select from the font menu.

lightning-omniscrypt

This attribute is new.

- `lwr` –Determines whether the component is compatible with Lightning Web Runtime (LWR) sites. Set this parameter to `true` if you want to embed your Omniscrypt on an LWR site.

lightning-radio-group

A `<div>` element that specifies `role="status"` has been added to contain an empty `<div>` element on load. When a field-level error occurs, the element renders a `<span>` element with the field label as assistive text for screen readers.

lightning-select

The `<div>` element that specifies `role="status"` now contains an empty `<div>` element on load. When a field-level error occurs, the element renders a `<span>` element with the field label as assistive text for screen readers.

lightning-tree

The chevron icon next to the tree item now uses the bare variant and displays in blue.

lightning-tree-grid

After you press the Right Arrow key on a row to expand the row, the subsequent Right Arrow key press now focuses on the checkbox column, if the column isn't hidden.

New and Changed Modules for Lightning Web Components

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These modules have changes.

New Modules

These modules are now available.

lightning/industriesConfigureApi

Uses the Configuration API of Revenue Management to manage the configuration, pricing, and lifecycle of carts and cart items, retrieve product, category, and bulk product details, and manage saved configurations and rules.

Changed Modules

These modules have changes.

lightning/graphql

This method is new.

- `executeMutation` –Create, edit, or delete record data from your JavaScript code. Use `executeMutation` imperatively with these parameters.
 - `query` –Parsed GraphQL query. Parse the query using the `gql` JavaScript template literal function. `gql` parses the GraphQL query into a format that `executeMutation` can use. `gql` isn't reactive.
 - `variables` –An object that provides GraphQL variables for the query.

For more information, see [GraphQL API](#).

lightning/navigation

Use the new `standard__flow` `PageReference` type. See [Navigate to Flows in Lightning Experience from Custom Lightning Components](#).

New and Changed Directives for Lightning Web Components

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Add dynamic behavior to an HTML template with directives.

New Directives

This directive is now available.

lwc:on={eventHandlers}

Adds event listeners to an element dynamically. You can also use this directive if you want to add event listeners whose event types are computed dynamically, for example, when passed from the owner component via `@api`.

See Also

[Lightning Web Components Developer Guide: HTML Template Directives](#)

Changed Aura Components

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These components have changes.

lightning:combobox

This component now correctly participates in validation and form submissions, so the browser can set focus on the component when it contains an invalid value and the form is validated on submission.

lightning:datatable

The height of the table container has been reduced by 3rem to display the horizontal scrollbar when the status bar is present, such as when data is changed in a cell during inline editing.

These accessibility behaviors are new.

- When you specify `displayReadOnlyIcon: true` and `editable:false`, the lock icon now displays inside a `<span>` element that contains `aria-label="Locked Column Name"` and `role="image"`, where `Column Name` refers to the label that you define for the column.
- The `<span>` element that contains assistive text for the lock icon has been removed.

lightning:input

The calendar on the input fields of type `date` and `datetime` have these accessibility changes.

- The `<select>` element for month and year selections now specify the `aria-describedby` attribute. The `<div>` element that specifies `role="status"` contains an empty `<div>` element. When a field-level error occurs, the element renders assistive text for screen readers.
- The `tabindex` attribute has been moved from the `<td>` elements on the calendar to the day buttons, which are inner `<span>` elements that specify `role="button"`.
- The `aria-selected`, `aria-current`, and `aria-disabled` attributes have been moved to the inner `<span>` element that specifies `role="button"`.

- The `aria-label` attribute has been added to the `<span>` element that specifies `role="button"`, which indicates `day month year, button`. For example: `8 October 2025, button`, depending on the screen reader.

lightning:inputAddress

If the Geolocation API times out after 10 seconds, the address lookup field defaults to San Francisco, CA with a latitude of 37.790091 and longitude of -122.396848 instead of your current position. A timeout can occur due to factors such as browser security settings, network conditions, and device capabilities.

lightning:inputField

The calendar on the input field of type `date` and `datetime` has the same accessibility changes as those for `lightning:input`.

lightning:navigation

Use the new `standard__flow PageReference` type. See [Navigate to Flows in Lightning Experience from Custom Lightning Components](#).

lightning:radioGroup

A `<div>` element that specifies `role="status"` has been added to contain an empty `<div>` element on load. When a field-level error occurs, the element renders a `<span>` element with the field label as assistive text for screen readers.

lightning:tree

The chevron icon next to the tree item now uses the bare variant and displays in blue.

lightning:treeGrid

After you press the Right Arrow key on a row to expand the row, the subsequent Right Arrow key press now focuses on the checkbox column, if the column isn't hidden.

Changed Aura Component Events

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The following event has changes.

lightning:omniChannelStatusChanged

This event attribute is new.

- **reason** –The reason for the Omni-Channel user's status change. Possible values are `OmniToolkitStatusChange`, `OmniPushTimeout`, `OmniDeclineWork`, `OmniManualStatusChange`, `OmniSupervisorStatusChange`, and `OmniLoginStatusChange`.

Apex: New and Changed Items

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These classes, enums, and interfaces are new or have changes.

For more information on these enhancements, see the [Apex Developer Guide](#) and the [Apex Reference Guide](#).

ConnectApi Namespace

The ConnectApi namespace (Connect in Apex) has new or changed classes, methods, or enums.

CommercePayments Namespace

The CommercePayments namespace has these new or changed classes, methods, interfaces, enums, or exceptions.

Database Namespace

The Database namespace has these new or changed classes, methods, interfaces, enums, or exceptions.

System Namespace

The System namespace has these new or changed classes, methods, interfaces, enums, or exceptions.

ConnectApi Namespace

The ConnectApi namespace (Connect in Apex) has new or changed classes, methods, or enums.

Many Connect REST API resource actions are exposed as static methods on Apex classes in the `ConnectApi` namespace. These methods use other `ConnectApi` classes to input and return information. The `ConnectApi` namespace is referred to as *Connect in Apex*.

For the new and changed ConnectApi classes, methods, and enums, see [ConnectApi \(Connect in Apex\)](#):

New and Changed Classes and Enums.

CommercePayments Namespace

The CommercePayments namespace has these new or changed classes, methods, interfaces, enums, or exceptions.

Changed Enums

Specify the payment failure category used to determine retry eligibility

Use the new `RetryCategory` enum.

Determines whether the payment operation can be retried based on the retry category

Use the new `RetryDecision` enum.

Specify the payment method type ID

Use the new `PaymentMethodIdType` enum.

Database Namespace

The Database namespace has these new or changed classes, methods, interfaces, enums, or exceptions.

New Classes

Paginate large SOQL query result sets

Use the `fetchPage()`, `fetchDeleted()`, and `getNumRecords()` methods in the `PaginationCursor` class. Use the `getNextIndex()`, `getNumDeletedRecords()`, `getRecords()`, and `isDone()` methods in the `CursorFetchResult` class.

System Namespace

The System namespace has these new or changed classes, methods, interfaces, enums, or exceptions.

New or Changed Methods in Existing Classes

Create an Apex pagination cursor to paginate large SOQL query result sets

Use the `Database.getPaginationCursor()` and `Database.getPaginationCursorWithBinds()` methods.

Get the number of Apex cursors that are created and their upper bounds

Use the `Limits.getApexCursors()` and `Limits.getLimitApexCursors()` methods.

Get the number of Apex pagination cursors that are created and their upper bounds

Use the `Limits.getApexPaginationCursors()` and `Limits.getLimitApexPaginationCursors()` methods.

Get the number of rows returned by an Apex pagination cursor and their upper bounds

Use the `Limits.getApexPaginationCursorRows()` and `Limits.getLimitApexPaginationCursorRows()` methods.

Specify the number of oldest, completed async jobs in your org to purge

Use the new method overload for `System.purgeOldAsyncJobs()`.

Use improved PDF rendering

The `Blob.toPdf()` method now uses the same PDF rendering service used by Visualforce.

See Also

[Use Apex Cursors for Expanded SOQL Query Result Support \(Generally Available\)](#)
[Specify the Number of Async Jobs to Delete](#)

ConnectApi (Connect in Apex): New and Changed Classes and Enums

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create custom experiences in Salesforce using Connect in Apex.

Many Connect REST API resource actions are exposed as static methods on Apex classes in the `ConnectApi` namespace. These methods use other `ConnectApi` classes to input and return information. The `ConnectApi` namespace is referred to as *Connect in Apex*.

ConnectApi Rate Limit Changes

To avoid potentially restrictive per user, per namespace, per hour ConnectApi rate limits, we're migrating orgs to the per org, per 24-hour Salesforce Platform API rate limit. Orgs created in Summer '24 and later are already using the Salesforce Platform API rate limit. For migrated and new orgs, only method calls that require Chatter are subject to the per user, per namespace, per hour rate limit.

New Connect in Apex Classes

These classes are new.

Changed Connect in Apex Input Classes

These input classes have changes.

Changed Connect in Apex Output Classes

These output classes have changes.

ConnectApi Rate Limit Changes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To avoid potentially restrictive per user, per namespace, per hour ConnectApi rate limits, we're migrating orgs to the per org, per 24-hour Salesforce Platform API rate limit. Orgs created in Summer '24 and later are already using the Salesforce Platform API rate limit. For migrated and new orgs, only method calls that require Chatter are subject to the per user, per namespace, per hour rate limit.

Where: This change applies to Lightning Experience, Salesforce Classic, and all versions of the Salesforce mobile app in all editions in all API versions.

When: Org migrations to the Salesforce Platform API rate limit continue on a rolling basis. Migrations occur in the background without notification.

New Connect in Apex Classes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These classes are new.

Commerce

These new methods are in the `ConnectApi.OrderSummary` class.

Get a wrapped list of sequenced amounts for order payment summaries

Use the

`getSequenceOrderPaymentSummaryInputList (List<SequenceOrderSummaryPaymentInputRepresentation> sequences)` method.

Get a sequenced list of amounts to apply to an order payment summary

Use the

`getSequenceOrderPaymentSummaryInputRepresentation (orderPaymentSummaryId, amount)` method.

Orchestration

This new method is in the `ConnectApi.Orchestration` class.

Get orchestration instances associated with another orchestration

Use the `getOrchestrationInstanceCollection (relatedRecordId, relatedOrchestrationId)` method.

Records

This new method is in the new `ConnectApi.RecordUi` class.

Get the values for all the picklist fields of a specific record type

Use the `getPicklistValuesByRecordType (objectApiName, recordTypeId)` method.

New output class: `ConnectApi.PicklistValuesCollection`

This method is useful for getting dependent picklist values. For example, if an object has a tree of dependent picklists, such as `Continents__c`, `Countries__c`, `Cities__c`, use this method to get all the values for each picklist in one request.

Salesforce CMS

These new methods are in the `ConnectApi.ManagedContent` class.

Get digital asset management (DAM) providers for a managed content space

Use the `getManagedContentProvidersForSpace (contentSpaceId)` method.

Update a digital asset management (DAM) provider instance

Use the `updateManagedContentProviderInstance (providerInstanceId, providerInstanceInput)` method.

Salesforce Flow

This new method is in the new `ConnectApi.FlowApprovalProcesses` class.

Get the status and available actions for flow approval processes

Use the `getFlowApprovalProcessWithStatus(relatedRecordId, processNames)` method.

New output class: `ConnectApi.FlowApprovalProcessCollection`

Changed Connect in Apex Input Classes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These input classes have changes.

Commerce

`ConnectApi.EnsureFundsAsyncInputRepresentation`

This input class has these new properties.

- `isAllowPartial` –Specifies if the invoice can be funded through multiple, partial payments.
- `SequenceOrderPaymentSummaryInputList` –Order payment summary preferred sequence list.

Changed Connect in Apex Output Classes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These output classes have changes.

Salesforce CMS

ConnectApi.ManagedContentDocument

This output class has these new and changed properties.

- `contentVersion` –Content version of the managed content.
- `variantVersion` –Variant version of the managed content.
- `version` –This property is no longer returned. For version information, use `contentVersion` and `variantVersion`.

ConnectApi.ManagedContentProviderCollection

This output class has this new property.

- `contentSpaceId` –ID of the managed content space, if provided.

ConnectApi.ManagedContentProviderInstance

This output class has this new property.

- `isEnabledForSpace` –Specifies whether the provider instance is enabled for the managed content space.

Service Email

ConnectApi.EmailMessageCapability

This output class has this new property.

- `emailSize` –Size of a case's email message HTML body.

API: New and Changed Items

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Access more data objects and metadata types in API version 66.0.

[New and Changed Objects](#)

Access more data through these new and changed standard objects.

[New and Changed Standard Platform Events](#)

Receive real-time notifications from Salesforce by subscribing to the channels of these new and changed standard platform events.

[Connect REST API](#)

Integrate mobile apps, intranet sites, and third-party web applications with Salesforce using Connect REST API.

CRM Analytics REST API

Set conditions and options in connector properties, configure table repeat grouping row values and persist action menus on dashboard widgets.

Invocable Actions

Invocable Actions represent the actions that can be accomplished on Salesforce with APIs.

Metadata API

Access more metadata through these new and changed metadata types.

REST API

These calls are new, changed, or deprecated in Platform REST API version 66.0.

Tooling API

Filter Test Discovery API results by using the new `category` query parameter. Access more metadata through new and changed Tooling API objects.

User Interface API

Build Salesforce UI for native mobile apps and custom web apps.

GraphQL API

See what's new with GraphQL API.

New and Changed Objects

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Access more data through these new and changed standard objects.

Salesforce Overall

Use Employee2 as a junction object between Contact and User

Use the new **User** field on the Employee2 object to reference a Unified Employee user record.

Marketing

New Fields on the Brief Object

Use additional fields on the Brief object to provide context that Agentforce can use when helping you create campaigns. Specify your calls-to-action and key performance indicators, and provide guardrails to protect your brand's reputation.

Sales

See the email addresses included in at least one email or event but who aren't saved as a contact or lead

Use the new `StagedUnmtchedEmailAddr` object. The new `StagedUnmtchedEmailAddrRela` object relates an unmatched email address to the activity (email message or event) where it appeared.

See the email addresses invite to at least one event but who aren't saved as a contact or lead

Use the new `EventInviteeEmailRelation` object. The new `EventInviteeEmailRelation` object relates an unmatched email address to the email message where it appeared so that the contact information and the event are associated as an activity.

Salesforce Flow

Get the version number of the flow that enabled persistent logging

Use the new `LogsEnabledFlowVersion` field on the existing `FlowRecord` object.

Security and Identity

Distinguish between enforced and reported content security policy (CSP) violations

Use the new `ViolationImpact` field on the existing `BrowserPolicyViolation` object.

BEHAVIOR CHANGE: The Customize Application permission is required to access `RedirectWhitelistUrl`

Previously, the Customize Application permission was required only for edit access to the `RedirectWhitelistUrl` object. Now that permission is required for read access, too.

Track usage of passkeys for passwordless login (Beta)

Use the new supported value `PasswordlessPasskeyLogin` in the existing `LoginType` field on the `LoginHistory` object.

Use the new supported value `PwlessPasskey` in the existing `VerificationMethod` field on the `VerificationHistory` object.

Use the new supported value `PasswordlessPasskeyLogin` in the existing `Policy` field on the `IdentityVerificationEvent` object.

 **Note** Passwordless login via passkeys is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Service

REMOVED: The `IsInboundReceiptsEnabled`, `IsRoutingWorkResultEnabled`, and `IsTypingIndicatorDisabled` fields on the `ConversationChannelDefinition` object are removed

Use the `EventCapabilitiesIsInboundAcknwOptionExposed` field instead of `IsInboundReceiptsEnabled`.

Use the `EventCapabilitiesIsRoutingWorkResultSupported` field instead of `IsRoutingWorkResultEnabled`.

Use the `EventCapabilitiesIsTypingIndicatorOptionHidden` field instead of `IsTypingIndicatorDisabled`.

REMOVED: The `HasInboundReceipts` and `HasTypingIndicator` fields on the `CustomMsgChannel` object are removed

Use the `EventCapabilitiesIsInboundAcknowledgementEnabled` field instead of `HasInboundReceipts`.

Use the `EventCapabilitiesIsTypingIndicatorDisabled` field instead of `HasTypingIndicator`.

Store callback routing information for a contact center channel with Omni-Channel Unified Routing

Use the new `OmniCallbackHandler` and `OmniCallbackFallbackQueueId` fields in the existing `ContactCenterChannel` object.

Configure callback details on a contact request for Omni-Channel Unified Routing

Use the new `AvailableCallbackAttempts` and `DelayBetweenCallbackAttempts` fields in the existing `ContactRequest` object.

New and Changed Standard Platform Events

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Receive real-time notifications from Salesforce by subscribing to the channels of these new and changed standard platform events.

Commerce

Be notified when a shopper abandons their shopping cart

Subscribe to `WebCartAbandonedEvent` to receive notifications related to abandoned carts.

Connect REST API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Integrate mobile apps, intranet sites, and third-party web applications with Salesforce using Connect REST API.

Connect REST API Rate Limit Changes

To avoid potentially restrictive per user, per application, per hour Connect REST API rate limits, we're migrating orgs to the per org, per 24-hour Salesforce Platform API rate limit. Orgs created in Summer '24 and later are already using the Salesforce Platform API rate limit. For migrated and new orgs, only requests that require Chatter are subject to the per user, per application, per hour rate limit.

New and Changed Connect REST API Resources

These resources are new or have changes.

Where: This change applies to Lightning Experience, Salesforce Classic, and all versions of the Salesforce mobile app in all editions in all API versions.

When: Org migrations to the Salesforce Platform API rate limit continue on a rolling basis. Migrations occur in the background without notification.

New and Changed Connect REST API Resources

These resources are new or have changes.

Commerce

Get the Commerce subscription action history

Make a GET request to the new `/commerce/webstores/webstoreId/subscriptions/subscriptionId/action-history` resource.

New request parameter: `effectiveAccountId`

New response body: Commerce Subscription Actions History

Exclude dynamic attributes information for the product from the response

Make a GET request to the existing `/commerce/webstores/webstoreId/products/productId` resource.

New request parameter: `excludeDynamicAttributeInfo`

Custom Domain

Get the pending configuration for a custom domain

Make a GET request to the new `/connect/custom-domain/domains/domainId/pending-configuration` resource.

New response body: Custom Domain Pending Configuration Detail

Notifications

Note Notification Actions is a beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) and applicable terms in the [Product Terms Directory](#). Use of this beta service is at the customer's sole discretion.

Get supported notification type details and actions (beta)

Make a GET request to the new `/connect/notifications/types` resource.

New response body: Notification Type Collection

Execute an action for a notification (beta)

Make a POST request to the new `/connect/notifications/notificationId/actionKey` resource.

New response body: Action Result

Orchestration

Get orchestration instances associated with another orchestration

Make a GET request to the existing `/connect/interaction/orchestration/instances` resource.

New request parameter: `relatedOrchestrationId`

Salesforce CMS

Get the specified version of a piece of managed content

Make a GET request to the existing `/connect/cms/contents/contentKeyOrId` resource.

New optional request parameter: `contentVersion`

Get digital asset management (DAM) providers for a managed content space

Make a GET request to the existing `/connect/cms/digital-asset-management-providers` resource.

New request parameter: `contentSpaceId`

Update a digital asset management (DAM) provider instance

Made a PATCH request to the existing `/connect/cms/digital-asset-management-providers/providerInstanceId` resource.

Salesforce Flow

Get the status and available actions for flow approval processes

Make a GET request to the new `/connect/interaction/flow-approval-process/status` resource.

New response body: Flow Approval Process Collection

Changed Connect REST API Request Bodies

These request bodies have changes.

Commerce

Ensure Funds Async Input

This request body has these new properties.

- `isAllowPartial` –Specifies if the invoice can be funded through multiple, partial payments.
- `SequencePaymentInputRepresentation` –Payment sequence input for capturing and applying funds to the invoice.
- `sequences` –Specifies the payment sequence in which the funds are captured for the invoice.

Changed Connect REST API Response Bodies

These response bodies have changes.

Commerce

Product Details

This response body has this new property.

- `dynamicAttributeCount` –Count of dynamic attributes associated with a product.

Salesforce CMS

Managed Content Document

This response body has these new and changed properties.

- `contentVersion` –Content version of the managed content.
- `variantVersion` –Variant version of the managed content.
- `version` –This property is no longer returned. For version information, use `contentVersion` and `variantVersion`.

Managed Content Provider Collection

This response body has this new property.

- `contentSpaceId` –ID of the managed content space, if provided.

Managed Content Provider Instance

This response body has this new property.

- `isEnabledForSpace` –Specifies whether the provider instance is enabled for the managed content space.

Service Email

Email Message Capability

This response body has this new property.

- `emailSize` –Size of a case's email message HTML body.

CRM Analytics REST API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Set conditions and options in connector properties, configure table repeat grouping row values and persist action menus on dashboard widgets.

New and Changed CRM Analytics REST API Resources

These resources are new or have changes.

Changed CRM Analytics REST API Request Bodies

These request bodies have changes.

Changed CRM Analytics REST API Response Bodies

These response bodies have changes.

New and Changed CRM Analytics REST API Resources

These resources are new or have changes.

Use the new property conditions and options in data connections

Make a GET request to the `/wave/dataConnectors` resource.

Response body includes the new Property Condition and Property Option representations.

Use the new update data cloud node in recipes

Make a GET request to the `/wave/recipes/${id}` resource.

Response body includes the new Update Data Cloud Node and Update Data Cloud Parameters representations.

Changed CRM Analytics REST API Request Bodies

These request bodies have changes.

Number Widget Input Parameters

The request body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not

(`false`).

Output Data Cloud Parameters

The request body has this new property.

- `eventTimeField` –The event time field.

Pill Box Widget Input Parameters

The request body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Repeater Widget Input Parameters

The request body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Selector Widget Input Parameters

The request body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Table Widget Parameters Input

The request body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).
- `repeatGroupingRowValues` –The repeat row values in a table.

Text Widget Input Parameters

The request body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Changed CRM Analytics REST API Response Bodies

These response bodies have changes.

Connection Property

The response body has these new properties.

- `conditions` –The conditions for the property.
- `options` –The options for the property.

Number Widget Parameters

The response body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Output Data Cloud Parameters

The response body has this new property.

- `eventTimeField` –The event time field.

Pill Box Widget Parameters

The response body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Repeater Widget Parameters

The response body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Selector Widget Parameters

The response body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Table Widget Parameters

The response body has these new properties.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).
- `repeatGroupingRowValues` –The repeat row values in a table.

Text Widget Parameters

The response body has this new property.

- `persistActionMenu` –Indicates whether to persist the widget actions menu (`true`) or not (`false`).

Wave Features

The response body has this new property.

- `canUpdateDataCloudObject` –Indicates whether update Data Cloud object is enabled for the org (`true`) or not (`false`).

Invocable Actions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Invocable Actions represent the actions that can be accomplished on Salesforce with APIs.

Invocable actions are available through REST API. The following actions are new or changed:

Control payment capture sequence

Use the new `isAllowPartial` field and `SequenceOrderPaymentSummaryInputList` representation with the existing `InvocableEnsureFundsOrderSummaryAsync` action.

Remove individuals from a single segment-triggered, automation event-triggered, or on-demand flow

Use the new `exitIndividualsFromFlow` action.

For more information on invocable actions, see the [Actions Developer's Guide](#).

Metadata API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Access more metadata through these new and changed metadata types.

Customization

Identify the asset related to an external service registration

Use the **registrationProviderAsset** field on the existing ExternalServiceRegistration metadata type. Available in API version 66.0 and later.

Education

Turn on Advancement Generative AI features for Education Cloud

Use the **enableAdvancementGenAI** field on the existing IndustriesSettings metadata type. Available in API version 64.0 and later.

Turn on the Advising Agent feature for Education Cloud

Use the **enableAdvisingAgent** field on the existing IndustriesSettings metadata type. Available in API version 64.0 and later.

Turn on Advanced Academic Operations features for Education Cloud

Use the **enableEduAdvncdAcadOper** field on the existing IndustriesSettings metadata type. Available in API version 64.0 and later.

Turn on the Student Recruitment Agent feature for Education Cloud

Use the **enableStudentRecruitmentAgent** field on the existing IndustriesSettings metadata type. Available in API version 64.0 and later.

Nonprofit

Turn on the Gift Entry Grid feature for Nonprofit Cloud

Use the **enableGiftEntryGrid** field on the existing IndustriesSettings metadata type. Available in API version 64.0 and later.

Turn on the Philanthropic Research Agent feature for Nonprofit Cloud

Use the **enablePhilResearchAgent** field on the existing IndustriesSettings metadata type.
Available in API version 64.0 and later.

Salesforce Flow

Customize your flow screens and screen components with style settings

Use the new **styleSettings** field, which is on the existing FlowScreen subtype of the Flow metadata type and on the FlowScreenFieldStyleProperties subtype of the FlowScreenField subtype.

Assign flow versions to a flow test

Use the new **flowTestFlowVersions** field on the existing FlowTest metadata type.

Configure a segment-triggered flow to run with more granularity

Use these new fields, which are on the existing FlowSchedule subtype of the FlowStart subtype.

- **dayOfMonthToRun**
- **daysOfWeekToRun**
- **frequencyNumber**

Use these new values, which are in the existing **frequency** field on the FlowSchedule subtype of the FlowStart subtype.

- `Monthly`
- `Yearly`
- `Hourly`
- `Weekdays`

Specify whether a segment-triggered flow sends messages to all contact points or a single contact point

Use these new fields that are on the existing FlowStart subtype of the Flow metadata type.

- **activationTemplate**
- **prioritizedContactPointsList**
- **sendMsgToOneContactPtPerIndv**

Specify an invocable action in the Start element of a broadcast flow

Use the new **fanOutAction** field on the existing FlowStart subtype of the Flow metadata type.

Reference metadata types as input parameters on invocable actions

Use the new `SetupReferenceObjectNameForAutomaticSetup`, `SetupReferenceObjectLabelForAutomaticSetup`, and `SetupReferenceFilterConditionForAutomaticSetup` values, which are in the existing **keys** field on the InvocableActionExtensionTargetAttribute subtype of the InvocableActionExtension metadata type.

Security and Identity

BEHAVIOR CHANGE: The Customize Application permission is required to access the RedirectWhitelistUrl metadata type

Previously, that permission was required only for edit access to this type. Now that permission is required for read access, too.

Configure the canvas settings for an external client app

Use the new ExtICIntAppCanvasSettings metadata type. Available in API version 66.0 and later.

Service

REMOVED: The isInboundReceiptsEnabled, isRoutingWorkResultEnabled, and isTypingIndicatorDisabled fields are removed from the ConversationChannelDefinition type

Use the **EventCapabilitiesIsInboundAcknwOptionExposed** field instead of **IsInboundReceiptsEnabled**.

Use the **EventCapabilitiesIsRoutingWorkResultSupported** field instead of **IsRoutingWorkResultEnabled**.

Use the **EventCapabilitiesIsTypingIndicatorOptionHidden** field instead of **IsTypingIndicatorDisabled**.

Store callback routing information for a contact center channel with Omni-Channel Unified Routing

Use the new **omniCallbackHandler** and **omniCallbackFallbackQueue** fields on the **ContactCenterChannel** subtype of the existing **CallCenter** type.

REST API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These calls are new, changed, or deprecated in Platform REST API version 66.0.

Changed Calls

Monitor query limit usage for scheduled flows and scheduled paths

Make a GET request to the existing `/services/data/vXX.X/limits` resource to obtain the new **ScheduledFlowRunLimit** and **ScheduledPathRunLimit** values.

Tooling API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Filter Test Discovery API results by using the new `category` query parameter. Access more metadata through new and changed Tooling API objects.

The *Tooling API Reference and Developer Guide* contains all Tooling API information.

Tooling API Changed Calls and Resources

These resources are new or have changes.

Tooling API New and Changed Objects

Access more metadata through these new and changed Tooling API objects.

Tooling API Changed Calls and Resources

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These resources are new or have changes.

Changed REST Resources

Filter Test Discovery API results by test category

Make a GET request to the existing `/services/data/v66.0/tooling/tests` resource.

The new query parameter is `category`. Existing categories are `apex` and `flow`.

See Also

[Filter Test Discovery API Results by Test Category](#)

Tooling API New and Changed Objects

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Access more metadata through these new and changed Tooling API objects.

Customization

Identify the asset related to an external service registration

Use the **registrationProviderAsset** field on the existing ExternalServiceRegistration type.
Available in API version 66.0 and later.

Mobile

Represents an individual action definition within a custom notification type

Use the new CustomNotifActionDef (Beta) object. This object is available in API versions 66.0 and later.

 **Note** Actionable notifications is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Represents a collection of related actions associated with a custom notification type

Use the new CustomNotificationActionGroup (Beta) object. This object is available in API versions 66.0 and later.

 **Note** Actionable notifications is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Service

REMOVED: The **IsInboundReceiptsEnabled**, **IsRoutingWorkResultEnabled**, and

IsTypingIndicatorDisabled fields on the ConversationChannelDefinition object are removed

Use the **EventCapabilitiesIsInboundAcknwOptionExposed** field instead of **IsInboundReceiptsEnabled**.

Use the **EventCapabilitiesIsRoutingWorkResultSupported** field instead of **IsRoutingWorkResultEnabled**.

Use the **EventCapabilitiesIsTypingIndicatorOptionHidden** field instead of **IsTypingIndicatorDisabled**.

REMOVED: The HasInboundReceipts and HasTypingIndicator fields on the CustomMsgChannel object are removed

Use the **EventCapabilitiesIsInboundAcknowledgementEnabled** field instead of **HasInboundReceipts**.

Use the **EventCapabilitiesIsTypingIndicatorDisabled** field instead of **HasTypingIndicator**.

User Interface API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Build Salesforce UI for native mobile apps and custom web apps.

[New and Changed User Interface API Resources](#)

These resources are new or have changes.

[Changed User Interface API Response Bodies](#)

These response bodies have changes.

[Supported Objects](#)

All new standard objects are auto-enabled for use with User Interface API.

See Also

[User Interface API Developer Guide](#)

New and Changed User Interface API Resources

These resources are new or have changes.

Records

Get the values for all the picklist fields of a specific record type

The GET request to the existing `/ui-api/object-info/{objectApiName}/picklist-values/{recordTypeId}` resource is now available in Connect in Apex in the `ConnectApi.RecordUi` class. See Records in [New Connect in Apex Classes](#).

Changed User Interface API Response Bodies

These response bodies have changes.

Records

Field

This response body has these new properties.

- `defaultValue` –Default value for the field.
- `defaultedOnCreate` –Indicates whether the field is defaulted when created.

Supported Objects

All new standard objects are auto-enabled for use with User Interface API.

To view new objects that are auto-enabled for User Interface API, see [New and Changed Objects](#).

These standard objects aren't new to your org but are new for User Interface API.

- `JournalReason`
- `PermissionSetLicense`

These standard objects are already supported in User Interface API, and they're newly supported for list views and most recently used list views.

- `SharingRecordCollection`
- `SharingRecordCollectionItem`

[User Interface API Developer Guide: Supported Objects](#)

GraphQL API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

See what's new with GraphQL API.

Create, update, or delete record data with mutations (generally available)

GraphQL mutations, which is now generally available, includes some changes since the beta release.

- The `RecordUpdatePayload` type includes a `Record` field that defines the fields that you want the response to return. For example, use this mutation query to update a contact record and specify the ID and name fields that you want the response to return.

```
mutation ContactUpdateExample{
  uiapi {
    ContactUpdate(input: {
      Contact: {
        FirstName: "Sam"
        LastName: "Smith"
      }
      Id: "003RM000008AAAAAA4"
    }) {
      Record {
        Id
        FirstName {
          value
        }
        LastName {
          value
        }
      }
    }
  }
}
```

This is the example response.

```
{
  "data": {
    "uiapi": {
      "ContactUpdate": {
        "Record": {
          "Id": "003RM000008AAAAAA4",
          "FirstName": {
            "value": "Sam"
          },
          "LastName": {
            "value": "Smith"
          }
        }
      }
    }
  }
}
```

```

      "lastName": {
        "value": "Smith"
      }
    }
  },
  "errors": []
}

```

Previously, the `RecordUpdatePayload` included a `success` field that returned `true` or `false`.

- Mutations are available via the GraphQL wire adapter. Use the new `executeMutation` method from the `lightning/graphql` module. See [New and Changed Modules for Lightning Web Components](#) for more information.

Update the last viewed date on records that you query

Query objects with the new `updateMRU` argument set to `true`, which also updates the `LastViewedDate` field on the records that are returned.

This example queries accounts with their IDs and names. The query also updates the `LastViewedDate` fields on the account records.

```

query accounts {
  uiapi {
    query {
      Account (updateMRU:true){
        edges {
          node {
            Id
            Name {
              value
            }
          }
        }
      }
    }
  }
}

```

This is the example response.

```

{
  "data": {

```

```

    "uiapi": {
      "query": {
        "Account": {
          "edges": [
            {
              "node": {
                "Id": "0015f000007wCAWAA2",
                "Name": {
                  "value": "Enfield Tennis Academy"
                }
              }
            },
            {
              "node": {
                "Id": "0015f000007vRRVAA2",
                "Name": {
                  "value": "Ennet House"
                }
              }
            }
          ]
        }
      }
    }
  }
}

```

Experience Cloud

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make your Aura and LWR site pages more discoverable to AI-powered search engines and improve the precision of AI-generated answers with generative engine optimization. Create richer HTML content for Aura and LWR sites and enjoy greater design flexibility on LWR sites with expanded HTML allowlists and

more readily available standard LWR components. Updates to Salesforce files make it easier for users to manage, delete, upload, and download files. The ability to create custom property types and editors for Aura and LWR sites is now generally available.

Aura and LWR Sites

Give your site pages a discoverability boost in AI-powered search engine responses with generative engine optimization. Send your Aura site visitors to another URL with easily implemented dynamic redirect rules. Improve your LWR site visitors' experience by returning them after a session timeout to the page they were viewing before their session ended.

Components in Experience Builder

Create rich HTML content in your Aura and LWR sites with the expanded allowlists for tags and attributes in the HTML Editor components. A wider array of components is available to LWR site builders in orgs without an active Community license, offering more expansive design possibilities. Use new components in your Aura and LWR sites to personalize visitors' home pages and let visitors submit records for approval.

Developer Productivity

Make component configuration more intuitive for Aura and LWR site builders with custom property editors and types, now generally available. The performance-related setting for connect APIs, previously beta in enhanced LWR sites, was removed.

Site Performance

Reduce the risk of downtime for custom domains that are served by a third party. For Visualforce sites, leave an empty value in the Site Favorite icon field and show your site visitors a cleaner browser tab. In 2026, Salesforce begins to migrate enhanced and custom domains that use the Salesforce Content Delivery Network to the Cloudflare CDN.

Salesforce Files

With the new Scan files for viruses or malware (beta) setting, users are blocked from uploading or downloading malicious files. The file size limit has increased from 2 GB to 10 GB. And to keep your files list organized and tidy, you can now enable more users to delete files that they don't own. Several of these features are ones that you requested on IdeaExchange.

Other Changes to Experience Cloud

Learn about other features that are available for Experience Cloud sites.

Aura and LWR Sites

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your site pages a discoverability boost in AI-powered search engine responses with generative engine optimization. Send your Aura site visitors to another URL with easily implemented dynamic

redirect rules. Improve your LWR site visitors' experience by returning them after a session timeout to the page they were viewing before their session ended.

Make Site Pages More Discoverable by AI

To make public site pages more discoverable by AI-powered search engines and enhance the precision of generated answers, enable generative engine optimization (GEO) in Experience Builder. When you enable GEO, AI bots can request content snapshots of your site's pages to generate answers more effectively.

Use Dynamic Redirect Rules in Aura Sites

Redirect users from your Aura site to another URL without any coding. Configure dynamic redirect rules that use a pattern to identify a URL from your site and redirect it. Previously, dynamic redirect rules were available only for LWR sites.

Return Users to Their Previous Page After Session Timeout

In all LWR sites, authenticated users are now returned to the page they were viewing before their session ended. Previously, the session timeout notification redirected users to the login page, and upon logging back in, they were returned to the Home page.

Make Site Pages More Discoverable by AI

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To make public site pages more discoverable by AI-powered search engines and enhance the precision of generated answers, enable generative engine optimization (GEO) in Experience Builder. When you enable GEO, AI bots can request content snapshots of your site's pages to generate answers more effectively.

Where: This change applies to [Aura and LWR sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

How: In Experience Builder, in SEO settings, enable **Provide content snapshots of public site pages when requested by AI bots**.

Note By enabling this setting, you're opting in to all LLMs listed in [SEO for Experience Builder Sites FAQ](#) in Salesforce Help.

Use Dynamic Redirect Rules in Aura Sites

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Redirect users from your Aura site to another URL without any coding. Configure dynamic redirect rules that use a pattern to identify a URL from your site and redirect it. Previously, dynamic redirect rules were available only for LWR sites.

Where: This change applies to [Aura sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

How: Configure dynamic redirect rules in the URL Redirects area of your site's Administration workspace.

Components in Experience Builder

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create rich HTML content in your Aura and LWR sites with the expanded allowlists for tags and attributes in the HTML Editor components. A wider array of components is available to LWR site builders in orgs without an active Community license, offering more expansive design possibilities. Use new components in your Aura and LWR sites to personalize visitors' home pages and let visitors submit records for approval.

Design LWR Sites with More Standard Component Options

Sixteen standard components are now available for use on all Lightning Web Runtime sites, even in orgs without an active Community license. Now you have a wider array of options to build and refine your LWR site pages. For example, add a banner, navigation menu, button, or video.

Create Richer HTML Content with More Supported Tags and Attributes

The HTML Editor component for Aura and Lightning Web Runtime sites supports an expanded list of HTML tags and attributes. Organize visual content with the figure and figcaption tags and sidebars or other tangential content with the aside tag. Use the audio tag to embed audio files for rich media experiences. Boost SEO with the footer, header, main, and section tags. Make your content readily accessible to screen readers with aria-* attributes.

Guide and Inform Experience Cloud Users with Personalized Task and Activity Components

Help Experience Cloud site users stay oriented and complete key actions with two personalized home page components: the Pending Task banner and the Activity Timeline. These components surface relevant tasks and recent activity to guide users when they return to your site

Submit Records for Approval by Using the Request Approval Component

Your credentialed site visitors can now submit records for approval directly from your site. Add the Request Approval component to an object detail page. Then configure the component to require submitters to select an approver and add comments about their request. The Request Approval component works only with Flow Approval Processes, not with Classic Approval Processes.

Design LWR Sites with More Standard Component Options

This release is in preview

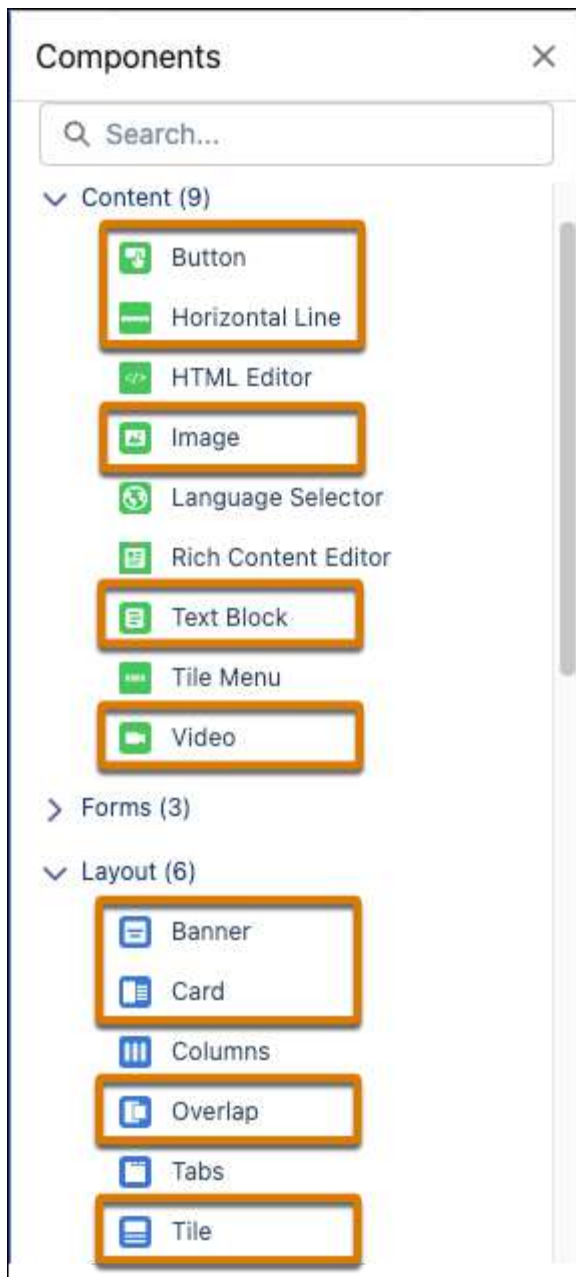

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Submit Records for Approval by Using the Request Approval Component

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Your credentialed site visitors can now submit records for approval directly from your site. Add the Request Approval component to an object detail page. Then configure the component to require submitters to select an approver and add comments about their request. The Request Approval component works only with Flow Approval Processes, not with Classic Approval Processes.

Where: This feature is available in Lightning Experience and in [Aura and LWR sites](#) accessed through Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Developer Productivity

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make component configuration more intuitive for Aura and LWR site builders with custom property

editors and types, now generally available. The performance-related setting for connect APIs, previously beta in enhanced LWR sites, was removed.

Create Custom Property Types and Editors for Lightning Web Components in Aura and LWR Sites (Generally Available)

Make your custom Lightning web components highly configurable in Experience Builder by adding custom property editors and property types. This feature, which is now generally available, includes some changes since the beta release.

Connect API Performance Beta Setting Was Removed

The **Improve performance of Connect APIs in your LWR site (Beta)** setting in the Preferences section of the site's Administration workspace was removed. This beta feature was originally available in enhanced LWR sites that made Connect REST API calls from Lightning web components.

Create Custom Property Types and Editors for Lightning Web Components in Aura and LWR Sites (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make your custom Lightning web components highly configurable in Experience Builder by adding custom property editors and property types. This feature, which is now generally available, includes some changes since the beta release.

Where: This change applies to [Aura and LWR sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

How: Create custom property types using the new `LightningTypeBundle`, which supports updates. Previously, the `ExperiencePropertyTypeBundle` didn't allow for updates.

To customize the editing experience specific to Experience Builder, create the `editor.json` file using the new format for `LightningTypeBundle` and place it within the `experienceBuilder` folder.

Important For previous beta participants who created custom property types using the `ExperiencePropertyTypeBundle`, we recommend that you replace that bundle with the new `LightningTypeBundle` and redeploy the components.

Connect API Performance Beta Setting Was Removed

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The **Improve performance of Connect APIs in your LWR site (Beta)** setting in the Preferences section of the site's Administration workspace was removed. This beta feature was originally available in enhanced LWR sites that made Connect REST API calls from Lightning web components.

Where: This change applies to [LWR sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

Site Performance

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reduce the risk of downtime for custom domains that are served by a third party. For Visualforce sites, leave an empty value in the Site Favorite icon field and show your site visitors a cleaner browser tab. In 2026, Salesforce begins to migrate enhanced and custom domains that use the Salesforce Content Delivery Network to the Cloudflare CDN.

[Simplify Custom Domain Management with a Stable Target Host Name](#)

If a third party serves your custom domain and your org uses Salesforce Edge Network, reduce your effort and the risk of downtime during Salesforce maintenance. Work with your third-party provider to update the domain's target host name to your org's My Domain login URL, which continues to work when your Salesforce instance changes. The current target host name works until your instance name or Hyperforce cell changes. We recommend that you update the target host name before your next org migration.

[Visualforce Sites Display Only the Specified Favicon](#)

Visualforce sites now support an empty value in the Site Favorite Icon field. The small icon appears in browser tabs, bookmarks, and search results for your site. Previously, when no icon was specified, users could see the Salesforce logo.

[Salesforce Migrates Enhanced and Custom Domains Serving Digital Experiences to Cloudflare CDN](#)

Beginning in 2026, Salesforce is migrating all enhanced and custom domains serving Digital Experiences that use the Salesforce Content Delivery Network (CDN) from Akamai to Cloudflare. Starting with the Spring '26 release, all enhanced and custom domains that use the Salesforce CDN service are created using the Cloudflare CDN as the default service provider. You can manually migrate custom domains to the Cloudflare CDN ahead of the Salesforce-initiated migration.

Finish Updating Your Legacy Force.com Site URLs

To ensure continued access to your sites, update references to your old site URLs that end in force.com. Redirections from those site URLs stop working in this release. Look for references to those URLs in Salesforce, such as in knowledge articles, and outside Salesforce, such as integrations and links in your marketing materials.

Simplify Custom Domain Management with a Stable Target Host Name

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

If a third party serves your custom domain and your org uses Salesforce Edge Network, reduce your effort and the risk of downtime during Salesforce maintenance. Work with your third-party provider to update the domain's target host name to your org's My Domain login URL, which continues to work when your Salesforce instance changes. The current target host name works until your instance name or Hyperforce cell changes. We recommend that you update the target host name before your next org migration.

Where: This change applies to Salesforce Sites and [Aura](#), [LWR](#), and [Visualforce sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Performance, and Unlimited editions. This change applies only to custom domains with the domain configuration "Use a third-party service or CDN to serve the domain."

Why: Custom domains serve your Digital Experiences or Salesforce Sites on a domain that you own, such as `https://www.example.com`. When a third-party service or content delivery network (CDN) serves your custom domain, the target host name routes your domain traffic to your Salesforce org. If that host name changes, your custom domain stops working until your third party updates the domain configuration to match.

Until you update your target host name to your My Domain URL, that host name contains your Salesforce instance or Hyperforce cell, which can change during an org migration. My Domain login URLs continue to work when those values change.

How: To get the target host name for your custom domain, in Setup, find and select **Domains**. Then click the name of your domain.

Domain

Salesforce Migrates Enhanced and Custom Domains Serving Digital Experiences to Cloudflare CDN

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Beginning in 2026, Salesforce is migrating all enhanced and custom domains serving Digital Experiences that use the Salesforce Content Delivery Network (CDN) from Akamai to Cloudflare. Starting with the Spring '26 release, all enhanced and custom domains that use the Salesforce CDN service are created using the Cloudflare CDN as the default service provider. You can manually migrate custom domains to the Cloudflare CDN ahead of the Salesforce-initiated migration.

Where: This change applies to [Aura](#) and [LWR](#) using the CDN accessed through Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

When: The migration occurs from January through June 2026.

How: To manually migrate your custom domain, from Setup, enter *Domains* in the Quick Find box and select **Domains**. From the list of domains, select the domain to edit. Select **Use the Cloudflare® CDN to serve this domain**. After the domain has migrated, you receive a notification. Click **Activate** to begin using the migrated domain.

Domain Edit [Save] [Save & New] [Cancel]

Domain Name: [text input]

Domain Configuration Option [x]

☐ Serve the domain with your HTTPS certificate on Salesforce servers

☒ Serve the domain with the Salesforce Content Delivery Network (CDN) [x]

☒ Use the Cloudflare® CDN to serve this domain [x]

We recommend this option for custom domains that serve Digital Experiences.

With this option, the Salesforce CDN partner service optimizes content delivery. All information that's sent to or returned by this domain is stored and transmitted through the CDN service.

To use this option, ensure that:

- The public DNS record of the domain name points directly to [domain].00dxx00jvudowq4eue.localhost1.salesforce.com.
- The public DNS record of the domain name includes a CNAME entry with hostname `_acme-challenge-[domain]` and target `_acme-challenge-[domain].00dxx00jvudowq4eue.localhost1.salesforce.com`

Visit [Salesforce Help](#) to learn how to serve your site content with Salesforce CDN, technical considerations, and prerequisites.

☐ Use a third-party service or CDN to serve the domain

[Enter your third-party hostname...]

☐ Use a temporary non-HTTPS domain [x]

Allow HSTS preloading registration [x]

☒ Allow HSTS preloading registration

After saving, you will need to activate the domain for your changes to take effect.

Salesforce Files

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With the new Scan files for viruses or malware (beta) setting, users are blocked from uploading or downloading malicious files. The file size limit has increased from 2 GB to 10 GB. And to keep your files list organized and tidy, you can now enable more users to delete files that they don't own. Several of these features are ones that you requested on IdeaExchange.

Protect Your Salesforce Org and Users by Scanning Files for Malware (Beta)

For improved security in your Salesforce org, files are now scanned for malware in Salesforce Files. When a user tries to upload a file, the process is blocked if the scanned file is malicious. If a malicious file is uploaded via the API, it's scanned asynchronously, and it appears in the new Malicious Files (Beta) list. When a user attempts to download an existing file, the download is blocked if it's malicious. This feature was developed based on your idea on IdeaExchange.

Manage Files up to 10 GB in Salesforce Files

Salesforce Files has increased the file size limit from 2 GB to 10 GB. The increased limit is available to Files home, libraries, and on a record's Files related list, but not to files uploaded to Chatter or LWR sites in Experience Cloud.

Allow More Users to Delete Files

Manage files in Salesforce more efficiently by assigning the new Delete Salesforce Files permission to your users. With this permission, a user can delete any file that they have access to view. Previously, only a Salesforce admin or the file owner could delete a file. This feature was developed based on your idea on IdeaExchange.

Protect Your Salesforce Org and Users by Scanning Files for Malware (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

For improved security in your Salesforce org, files are now scanned for malware in Salesforce Files. When

a user tries to upload a file, the process is blocked if the scanned file is malicious. If a malicious file is uploaded via the API, it's scanned asynchronously, and it appears in the new Malicious Files (Beta) list. When a user attempts to download an existing file, the download is blocked if it's malicious. This feature was developed based on your idea on IdeaExchange.

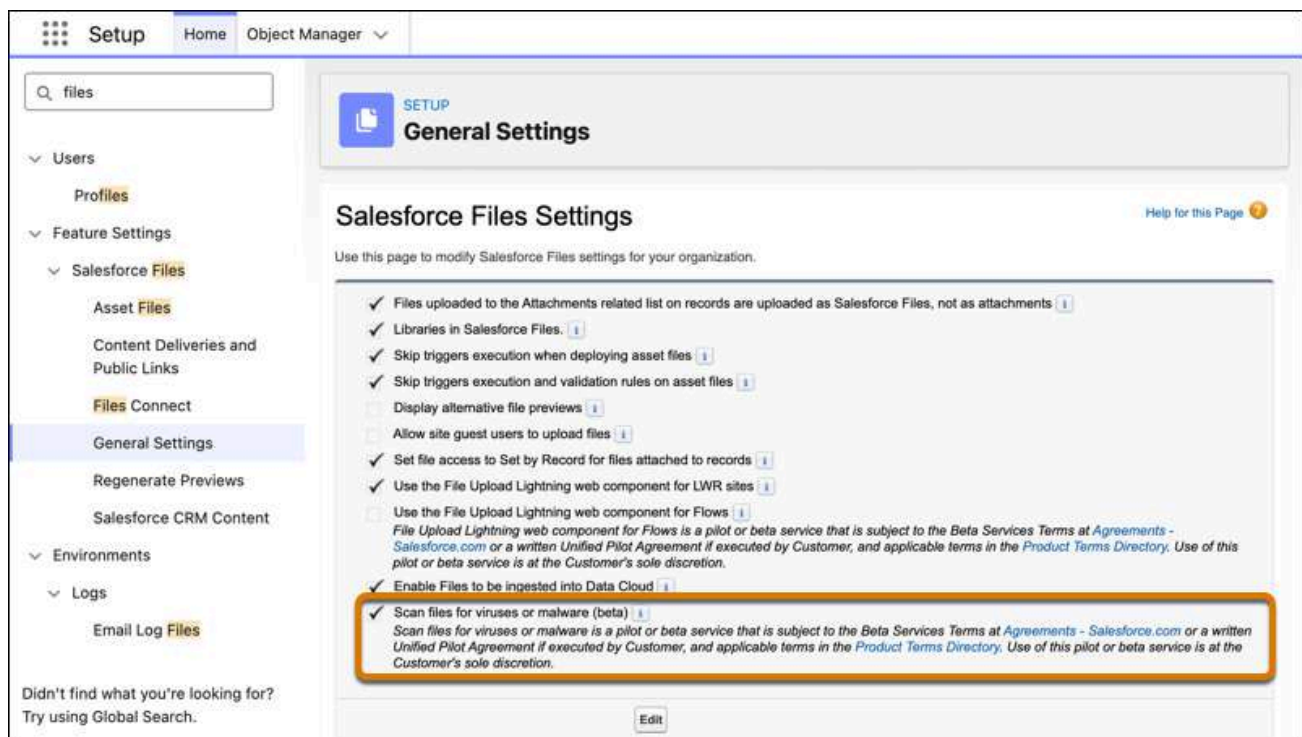

Where: This change applies to Salesforce Files accessed through Lightning Experience and Salesforce Classic in Essentials, Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer editions.

 **Note** Scan files for viruses or malware is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

When: This functionality is available on a rolling basis starting in Spring '26. For details about timing and eligibility, contact your Salesforce account executive.

Who: File owners, or users who have access to a file that was shared with them, can view a file even if it's malicious. To access the Malicious Files (Beta) list and all identified malicious files or to download malicious files, you need the Manage Malicious Files (Beta) user permission. To only download malicious files, you need the Download Malicious Files (Beta) user permission.

How: From Setup, in the Quick Find box, enter *Files*, and then select **Salesforce Files | General Settings**. The setting **Scan files for viruses or malware (beta)** is turned on by default. If a new file isn't scanned during the initial upload, it's scanned asynchronously and added to the Malicious Files List (Beta) if it contains malware.

Note Malware scanning in Salesforce Files flags only files that have a high probability of being malicious. If you require more stringent scanning, consider using one of Salesforce's malware scanning partners.

[Send Customers an Automated Email Confirming Their Scheduling Agent Request](#)

Automate a confirmation email to notify customers that their Agentforce request was successful. This timely communication improves customer experience and gives clear visibility into the outcome of customer requests.

[Streamline Pre-Work Brief with Rich Text](#)

Boost mobile worker productivity by transforming Pre-Work Brief from plain text into a rich resource. You can now use Markdown formatting to create content that is easier to read and structure, significantly improving clarity for complex instructions. Additionally, this update supports embedded hyperlinks, allowing mobile workers to access external resources, like collaboration channels and visual aids, without leaving their workflow.

Boost Pre-Work Brief Adoption with Enhanced User Experience

Mobile workers can now benefit from a more human-like voice when using Pre-Work Brief, making content easier to consume and enhancing overall accessibility. The updated voice technology replaces robotic tones with more natural speech patterns, improving clarity and making hands-free data entry more effective.

Send Customers an Automated Email Confirming Their Scheduling Agent Request

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Benefit from advanced features and better schedule quality with Enhanced Scheduling and Optimization.

Optimize Large Datasets in One Smooth Operation with Dynamic Scaling (Generally Available)

Set up and manage large-scale global and in-day optimization effectively without splitting data due to system limits. Dynamic scaling intelligently structures data into geographical clusters, seamlessly balancing demand and capacity while accounting for all operational work rule constraints. This capability simplifies optimization management by enabling higher system limits, so you don't need to manually define optimization groups and boundaries. It also prevents conflicts and overlaps that often occur with fragmented, parallel optimization runs. You can now easily select all service territories when you configure a scheduled optimization job without having to select each territory individually.

Previously, you had to define boundaries between areas that needed to be optimized together, making workforce planning difficult. Lower system limits meant you had to reduce the number of service appointments or service resources processed in a single request, and configure multiple optimization jobs. This fragmentation was tedious and affected overall business performance.

Get More Optimal Scheduling with Updated Service Objective Scoring Formulas

Achieve improved scheduling outcomes that match your business priorities with refined grading formulas that better reflect your configured service objective weights. The Same Site objective now has a much larger impact on the scheduling outcome. The impact of the Skill Preference and Skill Level objectives has doubled. And, the Resource Priority objective now relies on a fixed scale of 1 to 10 instead of the priority values sent in each optimization request, so that the schedule outcome is more predictable. Previously, some underlying calculations reduced the intended impact of an objective's assigned weight.

Access Optimization Request Files on Your Own (Generally Available)

Use Optimization Request Files to retrieve the request and response files of an optimization request. Review the files in a JSON format to find out what happened to a specific request and quickly resolve related issues. Previously, you had to open a Support case and wait to get the files, which delayed the troubleshooting process.

Get More Transparency into Service Operation Inefficiencies with Rule Violation Analytics (Beta)

Understand the root causes of rule violations in manual scheduling, such as geographical imbalances or skill gaps, and make data-driven decisions by analyzing trends and patterns. Rule Violation Analytics, built on the Enhanced Scheduling and Optimization Data Model, captures all rules that are manually violated on the Gantt. Easily query this data via a semantic data model and draw insights by creating a comprehensive dashboard in Tableau Next. Visualize rule violations, track metrics like the frequency of specific rule violations, and identify dispatchers or territories with recurring issues. Proactively address inefficiencies for better resource allocation, workforce planning, and dispatcher training.

Optimize Large Datasets in One Smooth Operation with Dynamic Scaling (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Lower system limits meant you had to reduce the number of service appointments or service resources processed in a single request, and configure multiple optimization jobs. This fragmentation was tedious and affected overall business performance.

Where: This feature is available in Lightning Experience and Salesforce Classic in Enterprise, Unlimited, and Developer editions with the Field Service managed package installed.

How: In Setup, go to Field Service Settings and verify that Field Service Enhanced Scheduling and Optimization is enabled. In the Field Service Admin app, go to Field Service Settings. Select **Optimization**, and then, in the Logic tab, select **Enable Dynamic Scaling**. Then select the **Scheduled Jobs** tab. For any job, you can select all service territories to be optimized in one group.

Experience Faster Dispatching with Enhanced Live Updates (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get near real-time updates when working with the dispatcher console Gantt by enabling the new Enhanced Live Updates setting. This setting's enhanced capabilities significantly reduce the Gantt's refresh times, dropping from 15–20 seconds to under 3 seconds. It lets you handle large datasets efficiently, experience a stable environment, and effectively manage time-sensitive and critical tasks. With this new setting, Experience Cloud site users can also benefit from live Gantt updates. Previously, live updates weren't available to Experience Cloud site users.

Where: This feature is available in Lightning Experience and Salesforce Classic and in [Aura](#), [LWR](#), and

[Visualforce sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Unlimited, and Developer editions with the Field Service managed package installed.

How: In the Field Service Admin app, click the Field Service Settings tab and select **Dispatcher Console UI**. Then turn on Enhanced Live Updates under Updating the Gantt.

Field Service Customer Engagement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance and elevate your customer interactions with several new features.

[Improve Sales Strategies with Visual Remote Assistant \(VRA\) Session Transcriptions](#)

Review transcripts of recorded VRA voice and video calls with automatic transcribing. Keep track of important action items and easily find information. Then gain insights, boost sales, and refine your sales strategies with Einstein Conversation Insights.

[Enable Private Mobile App Sharing in Visual Remote Assistant \(VRA\) Sessions](#)

Customers can now share an application window from their mobile device during VRA sessions, keeping the rest of their device screen private. Call center reps see only the relevant content. Privacy provides them with a secure and focused way to troubleshoot or review app-specific issues without seeing unrelated information.

[Preview and Manage Images in the Visual Remote Assistant \(VRA\) Self-Service Request](#)

Guest users on Salesforce Experience Cloud sites can now upload images more efficiently by previewing the images before sending them. They can remove any unwanted images and add images within VRA upload limits and guest security constraints. Previously, guest users couldn't review their image selections before uploading, requiring them to cancel the upload and start over to make changes.

[Validate Visual Remote Assistant \(VRA\) Permissions and User Access Easily from the Configuration Panel](#)

Check that permission sets and users have the required VRA access permissions from the new Access

Validation tab. Easily identify missing permissions and resolve installation, setup, or upgrade issues quickly and efficiently. Previously, you couldn't verify whether a permission set or user had VRA access permissions, often leading to manual checks, setup errors, and a longer troubleshooting cycle.

Improve Sales Strategies with Visual Remote Assistant (VRA) Session Transcriptions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Review transcripts of recorded VRA voice and video calls with automatic transcribing. Keep track of important action items and easily find information. Then gain insights, boost sales, and refine your sales strategies with Einstein Conversation Insights.

Where: This feature is available in Lightning Experience in Enterprise, Unlimited, and Developer editions with the Einstein Platform, Einstein for Sales, Einstein for Service, or Einstein for Field Service add-on. It also applies to Lightning Experience in Einstein 1 Field Service Edition. This feature also requires the installation of the Field Service managed package and Visual Remote Assistant. Einstein generative AI is available in Lightning Experience. Setup for Agentforce is available on the desktop site.

To purchase the Einstein Platform, Einstein for Sales, Einstein for Service, or Einstein for Service add-on, contact your Salesforce account executive.

How: Go to the App Launcher and search for Visual Remote Assistant Configuration. In the Audio Transcription Settings section, select **Enable Salesforce Transcribe**. Then select the default transcription language and save. Transcripts are saved in the Visual Remote Assistance Session record and linked to the corresponding work order or case record.

Field Service Mobile

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Explore what's new in Field Service mobile, designed to help mobile workers provide outstanding service.

Data Capture

Discover new features for Data Capture.

Enhance the Field Service Mobile App with Native GIS Mapping

Eliminate app switching and accelerate time to value by delivering advanced geospatial context directly within the Field Service mobile app. Help mobile workers access geospatial information focused on their work location with the new Geospatial Information System (GIS). With it, they can view, interact with, and update complex map data—including assets, lines, and polygons—even when

offline. Configure authentication and GIS map assignments with GIS' extensive customization capabilities to deliver an intuitive user experience. Simplify deployment and enhance data integrity with a robust connector that seamlessly pushes Salesforce data to ArcGIS feature layers.

Enhance the Mobile User Experience with a Configurable Feed

Accelerate work load times and eliminate unnecessary background data usage for improved performance by disabling Feed and Feed Priming, if mobile workers don't need access to Chatter while they're offline. You can now reduce complexity by removing the Feed entirely from the mobile app interface. Previously, the Feed tab on the mobile app was visible by default and you couldn't hide it.

Field Service Mobile App Support on Android 11 Is Deprecated

As of this release, support for the mobile app on Android 11 and earlier devices is deprecated.

Control Bulk Status Change Icon Visibility for Bundled Service Appointments

Avoid mishaps by disabling the Bulk Status Change Icon for Bundled Service Appointments in the Field Service mobile app. Previously, the icon was visible by default. Mobile workers could easily change the status of all bundled appointments with a single tap, potentially causing issues for customers with specific validation rules.

Work More Efficiently with the Revamped Work Order Overview Page

Enhance performance with the fast-loading work order overview screen. Each tab and card on the overview page now loads independently, so you can access critical information faster. The modernized user interface has a sleeker look and feel and optimized screen space, so you now see more content at a glance. Previously, you had to wait for all the tabs to load before seeing the entire user interface.

View Clear Information on Loading Stages During App Startup

Keep mobile workers informed with real-time progress updates on the app's loading status, eliminating guesswork about background processes. Previously, the home screen displayed a static Field Service logo with no visibility into the loading progress.

Optimize Your Mobile App Performance with Updated Technical Guidance

Get more reliable, long-term performance and lower your team's total cost of ownership by following the updated technical requirements for the Field Service mobile app.

Data Capture

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Discover new features for Data Capture.

Accelerate Data Entry and Improve Form Accuracy with the Data Capture Lookup Component

Help mobile workers find the exact records they need—like assets or products—by searching and selecting records directly in the Data Capture form, even when offline. With the new Lookup component, they can search by name or by any object field. Previously, mobile workers had to

manually enter text fields, which was tedious, slow, and error-prone.

Enhance Productivity by Previewing Multiple Images in Data Capture Forms

Give your mobile workers complete visual context for improved performance by displaying multiple related images directly within the Data Capture form, even when offline. The new Multiple Image Preview component can link to a record and access all images associated with it. Mobile workers can review images from previous jobs, and add images to the record after the form is created. They can preview thumbnails, zoom in on details, and swipe through a full-screen carousel of site photos. Previously, mobile workers could only view a single image that had to be uploaded when the form was created.

Boost Efficiency by Expanding Data Capture to Assets and Custom Objects

Minimize navigation time with access to Data Capture forms from the action launcher within asset and custom object records. Mobile workers can complete tasks faster by launching relevant forms directly from the specific asset or custom object that they're viewing. Previously, mobile workers could only launch forms as quick actions from work orders, work order line items, and service appointments.

Capture Data Even Faster with up to 80% Improvement in Form Loading Times

Improve mobile worker efficiency with faster loading times for complex Data Capture forms. Mobile workers can now access and load these forms within seconds, even those with multiple-choice fields, such as picklists, radio buttons, and checkbox groups.

Enhance Work Processes by Adding Data Capture Forms to Mobile Timesheets and Service Resources

Customize the mobile experience to fit your business needs and centralize data collection by adding Data Capture forms directly to mobile timesheets and service resource records. Expand the Field Service mobile app's capabilities by configuring screen flows to collect specific data, like meal expenses, mileage logs, or alternate contact details, without the need for custom Lightning web components.

Automate Hands-Free Data Entry with Data Capture Voice to Form (Generally Available)

Simplify tasks that require form entry/Improve speed and accuracy of data entry by integrating the powers of Speech-to-Text (STT) and Large Language Models (LLMs) with Data Capture Voice to Form. Mobile workers can now focus on their tasks instead of manually filling out forms, with a context-aware interface that captures information from natural voice dictation. Data Capture Voice to Form automatically transcribes and populates form fields by translating spoken work summaries into field-level responses. Drive even more accurate recommendations from your LLM by entering a component description in the new LLM Context field.

Accelerate Data Entry and Improve Form Accuracy with the Data Capture Lookup Component

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Enhance the Field Service Mobile App with Native GIS Mapping

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Eliminate app switching and accelerate time to value by delivering advanced geospatial context directly within the Field Service mobile app. Help mobile workers access geospatial information focused on their work location with the new Geospatial Information System (GIS). With it, they can view, interact with, and update complex map data—including assets, lines, and polygons—even when offline. Configure authentication and GIS map assignments with GIS' extensive customization capabilities to deliver an intuitive user experience. Simplify deployment and enhance data integrity with a robust connector that seamlessly pushes Salesforce data to ArcGIS feature layers.

Where: This feature is available in Lightning Experience in Performance and Unlimited editions, and in the Field Service mobile app for Android and iOS.

How: From Setup, in the Quick Find box, search for and select **Field Map Settings**.

Name	Map Provider	Authentication Method	Client Id	Base URL	Assignments	Actions
ESRI	ESRI	APP	VmP9WuTBH6xYYO	https://arcgis.com	4	
User Auth	ESRI	USER	VmP9WuTBH6xYYO	https://sfhesr.maps.arcgis.com	1	
Demo	ESRI	APP	JcP2Qu6Jl1uQluwQ	https://sfhesr.maps.arcgis.com	-	
Test_1	ESRI	APP	123456	https://arcgis.com	-	
Adar User Auth	ESRI	USER	HEC6Hng0WT7Rqa	https://demo.maps.arcgis.com	1

Enhance the Mobile User Experience with a Configurable Feed

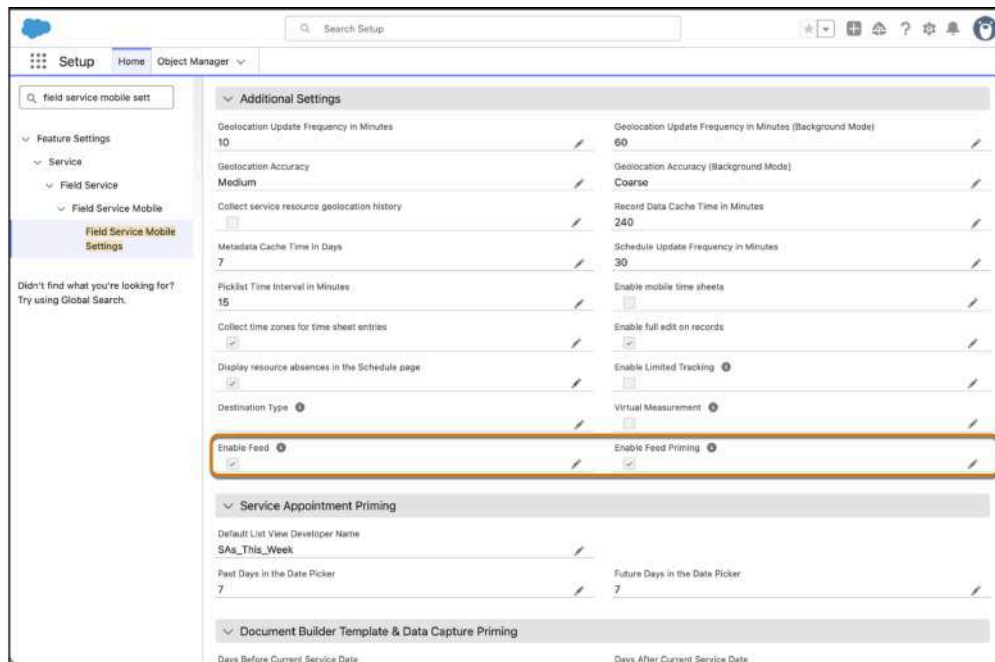

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Accelerate work load times and eliminate unnecessary background data usage for improved performance by disabling Feed and Feed Priming, if mobile workers don't need access to Chatter while they're offline. You can now reduce complexity by removing the Feed entirely from the mobile app interface. Previously, the Feed tab on the mobile app was visible by default and you couldn't hide it.

Where: This change applies to Lightning Experience in Unlimited, and Developer editions, and in the Field Service mobile app for Android and iOS.

How: In Setup, search for and select **Field Service Mobile Settings** and under Additional Settings, select **Feed and Feed Priming**.

Field Service Mobile App Support on Android 11 Is Deprecated

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

As of this release, support for the mobile app on Android 11 and earlier devices is deprecated.

Where: This change applies to the Field Service mobile app for Android.

How: The Winter '26 and later versions of the Field Service mobile app require Android 12 or later. The Summer '25 and earlier versions of the Field Service mobile app still work on Android 11 devices. To maintain access to critical security updates, bug fixes, and new features, update your mobile devices to the latest version of Android and the Field Service mobile app.

Important The Field Service mobile app must be no more than two major releases behind the Salesforce platform for the app to continue to work with Lightning web components. The Summer '25 version stops being compatible when the Summer '26 version is released.

Control Bulk Status Change Icon Visibility for Bundled Service Appointments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Avoid mishaps by disabling the Bulk Status Change Icon for Bundled Service Appointments in the Field Service mobile app. Previously, the icon was visible by default. Mobile workers could easily change the status of all bundled appointments with a single tap, potentially causing issues for customers with specific validation rules.

Where: This change applies to the Field Service mobile app in Android and iOS.

How: Set the **Attribute Key** to *Disabled Bundled SA Edit Button* and the **Attribute Value** to *True* in the Connected App Settings.

Work More Efficiently with the Revamped Work Order Overview Page

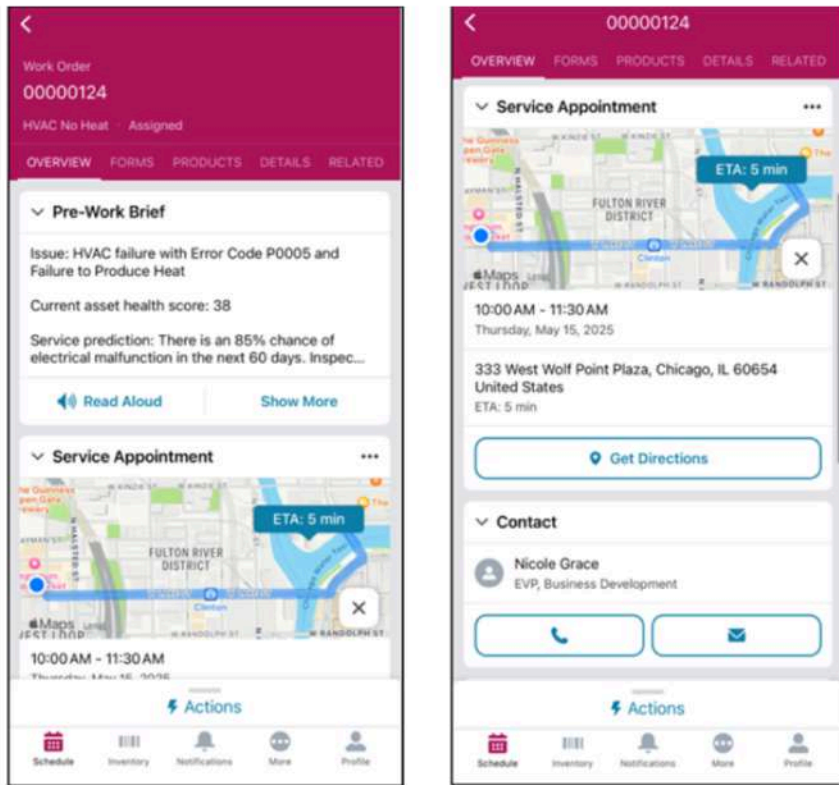

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance performance with the fast-loading work order overview screen. Each tab and card on the overview page now loads independently, so you can access critical information faster. The modernized user interface has a sleeker look and feel and optimized screen space, so you now see more content at a glance. Previously, you had to wait for all the tabs to load before seeing the entire user interface.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions, and in the Field Service mobile app for Android.

How: Tabs and cards load independently on the Work Order Overview tab.

See Also

[Salesforce Help: Customize the Layout of the Work Order Overview Screen \(can be outdated or unavailable during release preview\)](#)

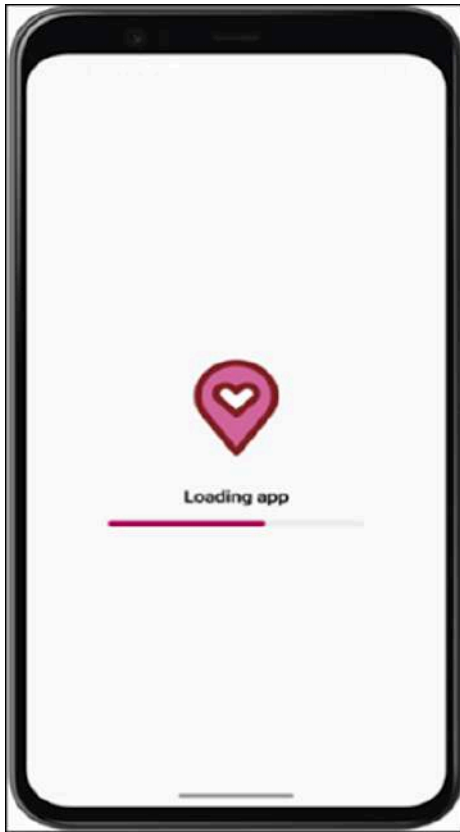

View Clear Information on Loading Stages During App Startup

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Keep mobile workers informed with real-time progress updates on the app's loading status, eliminating guesswork about background processes. Previously, the home screen displayed a static Field Service logo with no visibility into the loading progress.

Where: This change applies to the Field Service mobile app in Android and iOS.

Optimize Your Mobile App Performance with Updated Technical Guidance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get more reliable, long-term performance and lower your team's total cost of ownership by following the updated technical requirements for the Field Service mobile app.

Where: This change applies to the Field Service mobile app in Android and iOS.

Hyperforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Products and features from Data 360, Marketing Cloud, Platform, MuleSoft, and Tableau Cloud are now available in more Hyperforce regions. Hyperforce Assistant introduced a new way to find hard-coded references. The Hyperforce public IP ranges now include addresses for inbound connections, in addition to existing outbound addresses. Prepare for IPv6 if you use IP allowlists.

Access Salesforce in More Regions with Hyperforce

Hyperforce is available in 17 countries, giving you more choice and control over data residency.

Find Hard-Coded References Using the Updated Hyperforce Assistant Process

The automated check previously available in step one of Hyperforce Assistant has been replaced due to updates in underlying tools. The remaining Hyperforce Assistant features remain unchanged. Hyperforce Assistant helps customers prepare their org for migration. Because your org's instance changes during migration, hard-coded references cause functionality failures post-migration. Finding and resolving hard-coded references during the preparation phase enables applications to maintain correct functionality after the upgrade to Hyperforce.

Hyperforce Public IP Ranges Now Include Inbound Addresses

The Hyperforce public IP address ranges have been expanded to include inbound addresses for traffic to your Salesforce org. Previously, these ranges contained IP addresses only for connections from Salesforce to the customer network. Now, these ranges also contain IP addresses for inbound connections to your Salesforce org. Salesforce recommends adopting modern security practices, such as mTLS, instead of allowlisting on Hyperforce. But for customers with an insurmountable business or compliance requirement to use allowlists, Salesforce provides Hyperforce public IP ranges in JSON format.

Prepare for IPv6 in Hyperforce Public IPs

If you use an IP allowlist to restrict network traffic or you restrict access to Salesforce via IP address, prepare to update your allowlists to include IPv6 addresses.

Access Salesforce in More Regions with Hyperforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Hyperforce is available in 17 countries, giving you more choice and control over data residency.

Where: Delivery of the Salesforce Customer 360 application suite via Hyperforce, including Sales Cloud,

Service Cloud, B2B Commerce, Platform, and Industries clouds, is available in Australia, Brazil, Canada, France, Germany, India, Indonesia, Israel, Italy, Japan, Singapore, South Korea, Sweden, Switzerland, the United Arab Emirates, the United Kingdom, and the United States. For the most up-to-date list of products and regions, see the [Salesforce Trust and Compliance Documentation](#), including the [Hyperforce Security, Privacy and Architecture](#) document.

Why: These clouds and products recently expanded to new Hyperforce regions.

Cloud	Product or Feature	Description	Available In
Data 360	Agentforce, Data 360, and Einstein	The Hyperforce Geo Expansion for Data Residency provides in-country data residency for these Data 360 products.	Now available in Italy and Sweden. Also available in Australia, Brazil, Canada, France, Germany, India, Indonesia, Japan, Singapore, South Korea, Switzerland, the United Arab Emirates, the United Kingdom, and the United States.
Marketing Cloud	Marketing Cloud Advanced and Marketing Cloud Growth	Marketing Cloud products help build customer relationships efficiently with personalized marketing messages and automated journeys.	Now available in Italy and Sweden. Also available in Australia, Brazil, Canada, France, Germany, India, Indonesia, Japan, Singapore, South Korea, Switzerland, the United Arab Emirates, the United Kingdom, and the United States.
MuleSoft	For a complete list, see Salesforce Hyperforce Overview in the MuleSoft documentation.	MuleSoft provides a powerful integration platform that connects applications, data, and devices across any cloud or on-premises system.	Select features now available in US Cloud, EU Cloud, Canada Cloud, and Japan Cloud.

Cloud	Product or Feature	Description	Available In
Platform	Salesforce Advanced Cross-Region Continuity ¹	Salesforce Advanced Cross-Region Continuity is a premium product that provides an enhanced level of continuity to commercial Hyperforce customers during an extraordinary regional disaster.	Now available for Hyperforce commercial customers in Japan. Also available for Hyperforce commercial customers in the United States.
Platform	Shield Platform Encryption Database Encryption	Salesforce Shield helps you build extra levels of trust, compliance, and governance right into your business-critical apps. Encrypt entire orgs on Hyperforce with Salesforce Shield Database Encryption .	Now available in all commercial Hyperforce regions.
Tableau	Tableau Cloud	Tableau Cloud is a fully hosted, cloud-based, enterprise-grade analytics solution designed to empower organizations with intelligent tools and insights. Learn more in About the Hyperforce Migration .	Now available in South Korea. Also available in Australia, Canada, Germany, India, Indonesia, Japan, Singapore, Switzerland, the United Kingdom, and the United States.

Find Hard-Coded References Using the Updated Hyperforce Assistant Process

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

The automated check previously available in step one of Hyperforce Assistant has been replaced due to updates in underlying tools. The remaining Hyperforce Assistant features remain unchanged. Hyperforce Assistant helps customers prepare their org for migration. Because your org's instance changes during migration, hard-coded references cause functionality failures post-migration. Finding and resolving hard-coded references during the preparation phase enables applications to maintain correct functionality after the upgrade to Hyperforce.

Where: This change applies to Lightning Experience in all editions.

How: To check for hard-coded references and prepare your org for Hyperforce migration, [install and run the Salesforce Labs Org Check package](#). The Hyperforce Assistant guides you to the external package. If your needs aren't met by Org Check, log a support case.

Hyperforce Public IP Ranges Now Include Inbound Addresses

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Hyperforce public IP address ranges have been expanded to include inbound addresses for traffic to your Salesforce org. Previously, these ranges contained IP addresses only for connections from Salesforce to the customer network. Now, these ranges also contain IP addresses for inbound connections to your Salesforce org. Salesforce recommends adopting modern security practices, such as mTLS, instead of allowlisting on Hyperforce. But for customers with an insurmountable business or compliance requirement to use allowlists, Salesforce provides Hyperforce public IP ranges in JSON format.

Where: This change applies to all Salesforce orgs that manage connectivity using IP allowlists, including those on Hyperforce and on first-party infrastructure. These ranges support products built on the Salesforce platform, including Sales, Service, and Industries clouds, as well as Tableau and the MuleSoft Anypoint Platform. These addresses are not for email, and not for Marketing Cloud, Commerce Cloud, or Slack.

How: Access the Hyperforce public IP address ranges at <https://ip-ranges.salesforce.com/ip-ranges.json>.

Learn about new features and enhancements across the Industries clouds.

[Accounting Subledger](#)

Consolidate data between Salesforce CRM and your accounting system. Understand how and where funds are received, paid, and allocated.

[Asset Management](#)

Streamline, simplify, and upgrade your inventory operations and enhance service efficiency with the Asset Management features.

[Automotive](#)

Learn about the latest features from Agentforce Automotive, formerly Automotive Cloud. Boost sales and service productivity by using the Industries Sales Assistance and Asset Service Management agents. Improve customer service for Automotive finance processes through guided Omniscrypt intake forms for payment deferral. Simplify loan decisioning for funding analysts and dealers by using the Funding Workbench console. Use the recall inquiry service process to verify assets' recall status for customers. Easily associate vehicles and assets with fleets, view claims on product service campaign item records, and simplify setup and discovery for Automotive foundational features, Agentforce

features, and common components.

Channel Revenue Management

Improve partner collaboration with Stock Rotation Incentives by managing returns or scrapping unsold stock for incentives. Manage incentive spending by defining, allocating, and tracking budgets across stock rotation, standard rebates, ship and debit, and price protection programs. Enhance financial reporting with subledger integration by recording rebate claims and payouts in your Accounting Subledger.

Communications

Learn more about the latest features from Agentforce Communications, formerly Communications Cloud, that enhances your experience with access to new Industries common components. Manage larger orders and link cloned quotes to opportunities in Enterprise Sales Management. Discover, set up, and track usage of Revenue Cloud for Communications features with Salesforce Go. Boost revenue by applying promotions directly to a quote or an order.

Consumer Goods

Optimize retail execution with AI-driven insights in Consumer Goods Cloud with Retail Execution Visit Assistant. Streamline field operations for users with visit, order, and document cancellation. Prevent duplication of listing classification records with enhanced checks, and improve tour management with new and updated data objects. Diagnose and optimize sync performance using Named Query Analyzer. Generate professional documents with improved PDF previews, custom dimensions, and global date formats. Capture inventory actuals and streamline synchronization with the automatically installed TPM Data Connector. Set up certain Consumer Goods features from a single location through Salesforce Go.

Agentforce Energy & Utilities

Upload customer site data in bulk and automate group creation to generate complex quotes quickly. Discover and configure Agentforce Energy & Utilities features by using Salesforce Go.

Financial Services

Discover the power of Financial Services Cloud, which uses AI to unify customer data from banking, wealth, and insurance platforms. Financial Services Cloud enables personalized engagement, faster onboarding, and improved customer loyalty with industry-specific automation and AI-powered services. With trusted AI, the platform delivers intelligent insights for financial planning, helping customers achieve financial success.

Health

Discover, set up, and track usage of Agentforce Health, formerly Health Cloud, with Salesforce Go. Summarize claim and member coverage details by using Agentforce for Payer Contact Center. Improve data extraction accuracy by using custom extraction templates. Secure data continuity through offline assessments by using Home Health. Leverage Integrated Care Management to support suggested responses and autosave for all assessments. Resolve duplicate prior authorization request cases by using Utilization Management.

Insurance

Use Digital Insurance capabilities in your existing org along with the Insurance managed package or Insurance CRM. Optimize policy issuance, renewals, endorsements, and cancellations with complete versioning. Manage the end-to-end agency billing workflow with greater accuracy, automation, and financial control. Boost sales efficiency with unified multi-root quoting. Help users compare insurance

products side by side and select an optimal plan. Apply policy limits over more flexible durations, automatically cap payments at the lowest remaining limit, and authorize and track ex-gratia payments.

Life Sciences

Streamline your Account Management data with Data 360. Focus on the right accounts with the enhanced Next Best Customer component. Make quick, ad hoc adjustments to Activity Plans. Use the enhanced Activity Measure workflow to track a wider range of activities. Boost engagement efficiency with new remote visit capabilities, AI-based and voice-based data capture, and a centralized Visit Management experience in the Service Console. Drive informed execution and mitigate risks effectively with Collaborative Medical Insights. Use Smart Content Search to improve your search results and find relevant material. Send presentations as unique email links to help healthcare providers save time and find up-to-date content. Access real-time sales data on the Life Sciences Cloud mobile app and plan better customer interactions from anywhere.

Manufacturing

Discover new capabilities in Manufacturing that enhance efficiency across inventory, appraisals, and sales agreement workflows. From sample management and inventory allocation to data filtering and improved discoverability, these updates help you manage operations with greater accuracy and ease.

Media

Streamline the setup process for Agentforce Media features such as Advertising Inventory Management and media plans through Salesforce Go's centralized dashboard. Streamline workflows by processing line items individually and refreshing media grids instantly. Manage audio and video ad spots precisely with dedicated maximum ad runtimes and skippable options. Maximize campaign precision with advanced inclusion rules, granular postal code options, and MuleSoft Direct enhancements for Google Ad Manager. Use enhanced Salesforce Documentation Generation capabilities to create larger pitch decks and create quotes for customers across multiple geographical locations.

Net Zero

Learn about the latest features from Agentforce Net Zero, formerly Net Zero Cloud, that enhance data management, accounting, reporting, and sustainability insights. Scale your Agentforce Net Zero data management by using the ESG Data Collection Agent, powered by generative AI. Centralize environmental, social, and governance (ESG) data from multiple Salesforce orgs into a single source of truth in Data 360. Streamline the process of tracking and reporting Fuel and Energy-Related Activities (FERA) emissions and Transmission and Distribution (T&D) losses under Scope 3 Category 3. Extend Data 360 capabilities by accessing all data model objects (DMOs) and calculated fields.

Public Sector

Transform IT service delivery with Agent-First IT Support for Public Services. Accelerate hiring and simplify license discovery with Agentforce. Streamline investigative case management setup by using Salesforce Go, collect fees directly on your portal with Inbound Payments, and support complex reporting needs by generating larger documents.

Education

Learn about the latest features from Agentforce Education, formerly Education Cloud, that boost productivity throughout your organization. Support recruitment, admissions, academic operations, student success, advancement, and alumni engagement with the latest CRM and student information system (SIS) capabilities.

Nonprofits

Learn about the latest features from Agentforce Nonprofit, formerly Nonprofit Cloud, that boost productivity throughout your organization. Support fundraising, programs, grantmaking, outcomes, and volunteers with the latest CRM capabilities.

Industries Common Features

Learn about enhancements to features used across Industries products, Revenue Management, and other apps.

Accounting Subledger

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Consolidate data between Salesforce CRM and your accounting system. Understand how and where funds are received, paid, and allocated.

Align Accounting Subledger with Your Institution's Data Strategy

Adopt Data 360 to align financial data processing with your broader data architecture. Switch between Data 360 and CRM Analytics as the runtime for the Accounting Subledger Data Processing Engine without the need to reconfigure entire job definitions. Use either platform to manage accounting operations based on performance, scale, and licensing, and as needs evolve.

Align Accounting Subledger with Your Institution's Data Strategy

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Adopt Data 360 to align financial data processing with your broader data architecture. Switch between Data 360 and CRM Analytics as the runtime for the Accounting Subledger Data Processing Engine without the need to reconfigure entire job definitions. Use either platform to manage accounting operations based on performance, scale, and licensing, and as needs evolve.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Data 360, formerly Data Cloud, and the Accounting Subledger Growth add-on are enabled.

Who: Users with the Manage Accounting Subledger and Data Cloud Architect permission sets can use

this feature.

Asset Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline, simplify, and upgrade your inventory operations and enhance service efficiency with the Asset Management features.

Enhance Proactive Customer Service with Agentforce

Improve proactive customer service by using the enhanced features of the Asset Service Estimation agent topics as part of the Asset Service Management agent. Efficiently select price books for a chosen service work type, the relevant products and their quantities. Choose to specify a different coverage for each product and simplify the process of incorporating asset warranties, entitlements, or service contracts. Create a more enriched quote with the specific discount details for each selected product. Create work orders with an asset's account ID and with the asset name and work type name in the subject

Inventory Management Enhancements

Enhance operational efficiency with new capabilities that streamline inventory management.

Manage Asset Recall Inquiries Using Prebuilt Service Templates

Use prebuilt service process templates to handle asset-related recall inquiries, such as eligibility questions or dealer appointment details. These templates help Original Equipment Manufacturers (OEMs) accelerate implementations, enabling faster deployments and improving operational efficiency. Easily view the list of assets for the selected customer account, check whether a specific asset is part of an active recall, and share details of the relevant authorized service partners. A case is created and automatically closed post fulfillment of the service process request and an email is sent to the customer with the relevant recall inquiry details.

Access Claims from Product Service Campaign Items

View claims on a product service campaign item record. Assign a related list and access the claims associated with a particular product service campaign item.

Timesheet and Labor Cost Optimization Enhancements

Enable field technicians to associate assets with timesheets and capture detailed information by using configurable forms. Technicians can update verified timesheets to maintain accuracy, while supervisors and admins control the visibility of entry fields to match operational needs. Service resources can use Agentforce to handle time-tracking tasks like creating and verifying timesheets.

Upsell and Cross-Sell Products for Service with Agentforce

Use Agentforce to empower every technician and service rep, regardless of their expertise, to identify and propose upgrades or add-ons for specific assets or recommend new products during customer interactions. The agent navigates users through product discovery, clarifies user intent for accuracy, and identifies the most relevant product options based on customer needs. It then helps generate quotes for selected products and capture quote approval.

Enhance Proactive Customer Service with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve proactive customer service by using the enhanced features of the Asset Service Estimation agent topics as part of the Asset Service Management agent. Where: This feature is available in Lightning Experience for Automotive, Communications, Energy and Utilities, Manufacturing, and Media, where Asset Service Lifecycle Management and the industry specific Agentforce add-ons are enabled.

Who: To use the Asset Service Estimation agent topics, users need the Agentforce Default Admin, Scheduler, Industry Service Excellence, Prompt Template Manager, Prompt Template User, Industries Field Service and industry specific permission sets.

How: To give users the ability to manage asset services for customers by using an AI agent, in Setup, on the Agentforce Agents page, click **New Agent**. Then, select the Asset Service Management agent in Agent Builder.

To use the Asset Service Estimation topic, launch the Agentforce panel, and specify an utterance, such as *Give me repair estimates for this Asset..*

Inventory Management Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance operational efficiency with new capabilities that streamline inventory management.

Improve Order Fulfillment Accuracy with Inventory Allocation

Manage inventory allocation for sales orders and work orders across multiple locations with accurate, real-time visibility. View stock statuses, such as on-hand, allocated, and available, and soft-reserve inventory for specific orders. Assign inventory to orders to prevent overcommitment and maintain accurate inventory visibility, even during high-volume, concurrent transactions. This helps prevent stock conflicts, improves tracking accuracy, and supports smarter, more efficient fulfillment decisions.

Streamline Inventory Counting Across Locations

Easily manage inventory counts across hierarchical structures, such as warehouses or service fleets, without creating separate plans for each room, aisle, or field service vehicle. Using the Location Hierarchy, you can easily define parent and child locations, so selecting a parent location in a plan automatically displays all its associated child locations. Inventory managers can then select child locations and bulk add or choose product items to create a single, comprehensive inventory count plan.

New and Changed Objects for Inventory Management

Do more with the new and updated objects for Inventory Management.

Improve Order Fulfillment Accuracy with Inventory Allocation

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage inventory allocation for sales orders and work orders across multiple locations with accurate, real-time visibility. View stock statuses, such as on-hand, allocated, and available, and soft-reserve inventory for specific orders. Assign inventory to orders to prevent overcommitment and maintain accurate inventory visibility, even during high-volume, concurrent transactions. This helps prevent stock conflicts, improves tracking accuracy, and supports smarter, more efficient fulfillment decisions.

Where: This feature is available in Lightning Experience for Automotive, Communications, Energy and Utilities, Manufacturing, and Media, where Asset Service Lifecycle Management is enabled.

Who: This feature is available to users with the Inventory Allocation and Inventory Search and Transfer permission sets.

Why: Tracking only the total on-hand quantity is often insufficient and can lead to over-promising and inaccurate order fulfillment. Allocating inventory with full visibility into inventory statuses allows you to

clearly identify which portion of stock is truly available for new orders and which portion is already soft-reserved for existing commitments. This improves order fulfillment accuracy and supports more reliable operations.

How: Add the Inventory Allocation component to the Order and Work Order pages to view and create allocations for products available as line items.

Streamline Inventory Counting Across Locations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Do more with the new and updated objects for Inventory Management.

Changed Objects

Store the quantity of product items that are allocated but not yet shipped.

Use the new field *Quantity Allocated on Product Item*.

Store the quantity of product items that are currently available in inventory.

Use the new field *Quantity Available on Product Item*.

Store the date and time when the quantity status of the product item was last updated.

Use the new field *Quantity State Refresh Date* on Product Item.

New Objects

Represent the production batch details for a product campaign definition item.

Use the new *Inventory Reservation* object.

Represent inventory item reservation information for a specific product and location.

Use the new *Inventory Item Reservation* object.

Represent an individual transaction that records a change in the state and quantity of a specific product item.

Use the new *Product Item Additional Transaction* object.

Manage Asset Recall Inquiries Using Prebuilt Service Templates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use prebuilt service process templates to handle asset-related recall inquiries, such as eligibility questions or dealer appointment details. These templates help Original Equipment Manufacturers (OEMs) accelerate implementations, enabling faster deployments and improving operational efficiency. Easily view the list of assets for the selected customer account, check whether a specific asset is part of an active recall, and share details of the relevant authorized service partners. A case is created and automatically closed post fulfillment of the service process request and an email is sent to the customer with the relevant recall inquiry details.

Where: This feature is available in Lightning Experience in Automotive Cloud, Partner Community for Experience cloud sites, Communications Cloud, Energy and Utilities Cloud, Manufacturing Cloud, and Media Cloud where Asset Service Lifecycle Management, Product Service Campaign Management, Unified Catalog, Industries Service Excellence, and Industries Field Service add-ons are enabled.

Who: To use this feature, users need the Product Service Campaign, Industry Service Excellence, and Unified Catalog Admin permission sets.

How: On an Account page, initiate a recall inquiry request from the Action Launcher.

Access Claims from Product Service Campaign Items

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

View claims on a product service campaign item record. Assign a related list and access the claims associated with a particular product service campaign item.

Where: This feature is available in Lightning Experience in Automotive Cloud, Communications Cloud, Energy and Utilities Cloud, Manufacturing Cloud, and Media Cloud where Asset Service Lifecycle Management, Product Service Campaign Management, Unified Catalog, Industries Service Excellence, and Industries Field Service are enabled.

Who: To use this feature, users need the Product Service Campaign, Industry Service Excellence, and Unified Catalog Admin permission sets.

Timesheet and Labor Cost Optimization Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enable field technicians to associate assets with timesheets and capture detailed information by using configurable forms. Technicians can update verified timesheets to maintain accuracy, while supervisors and admins control the visibility of entry fields to match operational needs. Service resources can use Agentforce to handle time-tracking tasks like creating and verifying timesheets.

[Agentforce for Timesheets and Labor Cost Optimization](#)

Improve the productivity of your service resources by integrating Agentforce AI capabilities into your workforce management processes. Service resources can use dedicated Agentforce actions to create, manage, and verify their timesheets efficiently.

[Associate Assets and Equipment with Timesheets](#)

Track the usage of heavy equipment and other assets by associating them directly with timesheets and individual timesheet entries. Field technicians can now input asset details when creating or updating their timesheets.

Capture Details with Configurable Forms

Enhance data collection in the field by configuring data capture forms on the Field Service mobile app. By using Flows and Lightning Web Component cards, you can create custom forms for technicians to capture specific details on the home page and the Timesheets page.

Control Timesheet Entry Field Visibility

Align the Timesheets app with your operational needs by controlling the available fields for technicians. You can now configure specific fields, such as a custom picklist for delay reasons, to appear when a technician creates or edits a timesheet entry.

Update Verified Timesheets

Keep timesheets accurate without waiting for supervisor approval to reopen them. Field technicians can now add, update, or delete timesheet entries even after a timesheet is in the verified state. When you add a new entry to a verified timesheet, the system updates the start and end times of the parent timesheet entry.

Agentforce for Timesheets and Labor Cost Optimization

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve the productivity of your service resources by integrating Agentforce AI capabilities into your workforce management processes. Service resources can use dedicated Agentforce actions to create, manage, and verify their timesheets efficiently.

Manage Timesheets and Timesheet Entries with Agentforce

Service resources can now record their activities, such as work, drive, and break times. They can also access a comprehensive view of timesheet data, including status and validation errors, to resolve issues. Furthermore, they can seamlessly initiate the verification or submission process for their timesheets.

New Invocable Actions in Timesheets and Labor Cost Optimization

Do more with the new invocable actions in Energy and Utilities Cloud.

Manage Timesheets and Timesheet Entries with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Service resources can now record their activities, such as work, drive, and break times. They can also access a comprehensive view of timesheet data, including status and validation errors, to resolve issues. Furthermore, they can seamlessly initiate the verification or submission process for their timesheets.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with the Agentforce Employee Agent add-on. Agentforce Employee Agent uses Flex Credits under the Salesforce Foundations Entitlements model.

Important This feature uses [Einstein Generative AI](#) and may consume Einstein Requests or Flex Credits or Data Cloud Requests. [Einstein Generative AI Features](#) and Data Cloud are provided on a separate infrastructure with different security protections and physical hosting locations than the Services. See [Salesforce Trust and Compliance Documentation](#) for more information.

Note The user interface of this product is available only in English and may not be fully supported in other languages.

Who: To use Agentforce for Timesheets, you need the Agentforce Employee Agent add-on and the relevant Field Service permissions.

How: Use these actions to manage timesheets within Agentforce.

- **Create Timesheets and Timesheet Entries:** Creates timesheets and entries for the current user. Categories for entries can be resolved to values such as WorkTime, DriveTime, BreakTime, and MealTime.
- **Verify Or Submit Timesheet:** Initiates the process of verification or submission for a specific timesheet date.
- **Get Timesheet Details:** Gets the main timesheet record, associated entries, and any unresolved validation errors for a selected date.

New Invocable Actions in Timesheets and Labor Cost Optimization

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with the new invocable actions in Energy and Utilities Cloud.

Create timesheets and timesheet entries for the current user

Use the createTimesheetsAndTimesheetEntries action.

Initiate the process of verification or submission of a timesheet

Use the verifyOrSubmitTimesheet action.

Get the details including the timesheet, timesheet entries, and timesheet validation errors

Use the `getTimesheetDetails` action.

Associate Assets and Equipment with Timesheets

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Track the usage of heavy equipment and other assets by associating them directly with timesheets and individual timesheet entries. Field technicians can now input asset details when creating or updating their timesheets.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Agentforce Energy & Utilities.

Capture Details with Configurable Forms

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Enhance data collection in the field by configuring data capture forms on the Field Service mobile app. By using Flows and Lightning Web Component cards, you can create custom forms for technicians to capture specific details on the home page and the Timesheets page.

Where: This change applies to the Field Service mobile app for Android and iOS, and Lightning Experience in Enterprise, Performance, and Unlimited editions with Agentforce Energy & Utilities.

Control Timesheet Entry Field Visibility

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

Align the Timesheets app with your operational needs by controlling the available fields for technicians. You can now configure specific fields, such as a custom picklist for delay reasons, to appear when a technician creates or edits a timesheet entry.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Agentforce Energy & Utilities.

Update Verified Timesheets

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Keep timesheets accurate without waiting for supervisor approval to reopen them. Field technicians can now add, update, or delete timesheet entries even after a timesheet is in the verified state. When you add a new entry to a verified timesheet, the system updates the start and end times of the parent timesheet entry.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Agentforce Energy & Utilities.

Upsell and Cross-Sell Products for Service with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Agentforce to empower every technician and service rep, regardless of their expertise, to identify and propose upgrades or add-ons for specific assets or recommend new products during customer interactions. The agent navigates users through product discovery, clarifies user intent for accuracy, and identifies the most relevant product options based on customer needs. It then helps generate quotes for selected products and capture quote approval.

Where: This feature is available in Lightning Experience for Automotive, Communications, Energy and Utilities, and Manufacturing. To access it, you must have Asset Service Lifecycle Management, the Industries Field Service add-on, and the industry-specific Agentforce add-on enabled.

How: In Setup, turn on Asset Service Lifecycle Management. Then, assign the Agentforce permission set to your users and configure the Upsell and Cross-sell agent topic.

Automotive

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about the latest features from Agentforce Automotive, formerly Automotive Cloud. Boost sales and service productivity by using the Industries Sales Assistance and Asset Service Management agents. Improve customer service for Automotive finance processes through guided Omniscript intake forms for payment deferral. Simplify loan decisioning for funding analysts and dealers by using the Funding Workbench console. Use the recall inquiry service process to verify assets' recall status for customers. Easily associate vehicles and assets with fleets, view claims on product service campaign item records, and simplify setup and discovery for Automotive foundational features, Agentforce features, and common components.

Automotive Cloud is now Agentforce Automotive. You may see references to Automotive Cloud in our application and documentation.

Agentforce for Automotive

Enhance sales productivity and proactive customer service by using the Industries Sales Assistance and Asset Service Management agents. Sales reps can automate tasks like searching for products, accessories, and parts, creating opportunities with dealer mapping, and generating quick quotes with manual discounts. Service reps can efficiently manage service estimations, incorporating price books, product coverage, and warranties to produce enriched, detailed customer quotes.

Automotive Finance

Enable efficient Payment Deferral service process request intake through guided Omniscript forms for customers and service reps. Enhance lending processes with the Funding Workbench app for post-contract document review. Improve the dealer experience by simplifying document upload, task management, and communication for loan contract finalization.

Streamline Recall Inquiries with a Prebuilt Service Process

Simplify the intake and fulfillment of recall inquiry service process requests by using a prebuilt screen flow. Customer support reps can efficiently verify an asset's recall status and assist customers in locating authorized dealers for booking appointments. Easily view the list of assets with an open recall for a customer account, and check its relevant details such as the associated product service campaign and the preferred partner. A case is created and automatically closed post fulfillment of the service process request and an email is sent to the customer with the relevant recall inquiry details.

Access Automotive Claims from Product Service Campaign Items

View Automotive claims on a product service campaign item record. Assign a related list and access

the claims associated with a particular product service campaign item.

Accelerate Automotive Feature Discovery and Setup

Discover, set up, and configure Automotive Agentforce agents such as Asset Finance Management, Industries Customer Engagement, and Industries Sales Assistance with more efficiency by using Salesforce GO. Manage Automotive finance processes by setting up Vehicle and Asset Lending and other related features from a single location. Discover common components such Record Alerts, Events and Milestones, Discovery Framework, and Complaint Data Sharing to streamline Automotive business operations. Enable cross-cloud features such as Inventory Count, Actionable Event Orchestration, and Inventory Search and Transfer to deliver better service.

Associate Vehicles and Assets to Fleets Faster

Easily associate vehicles or assets to a new fleet or an existing fleet, from a fleet record page, or an asset or vehicle list view. Search for vehicles using Criteria-Based Search and Filter and assign them immediately to an existing fleet based on the search result. Ensure efficient fleet management, optimizing workflows for fleet managers and inventory specialists.

Enable Stage Management for Key Automotive Objects

Implement stage management across critical Automotive objects such as Appraisal, Fleet, Vehicle, and Product Service Campaign Group Definition. Provide a structured, traceable, and controlled process for managing the life-cycle of Automotive business operations through defined stages. Maximize service efficiency, reduce turnaround time, and enhance customer lifetime value.

Expand Automotive Data Access and Mapping

Utilize file-based data kits to access data streams, data model objects (DMOs), and mappings for Automotive business use cases. Use four new DMOs, Inventory Serialized Product, Lead Line Item, Business Profile, and Account Location to support newer analytics by using Tableau Unified Analytics and other relevant use cases in data cloud.

New and Changed Objects for Agentforce Automotive

Do more with the new and changed Agentforce Automotive, formerly Automotive Cloud, objects.

Agentforce for Automotive

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance sales productivity and proactive customer service by using the Industries Sales Assistance and Asset Service Management agents. Sales reps can automate tasks like searching for products, accessories, and parts, creating opportunities with dealer mapping, and generating quick quotes with manual discounts. Service reps can efficiently manage service estimations, incorporating price books, product coverage, and warranties to produce enriched, detailed customer quotes.

Boost Sales Productivity with Industries Sales Assistance

Search for products and relevant accessories, find relevant dealers that sell them, create a single opportunity for multiple selected products, and manage trade-in requests for assets with the Industries Sales Concierge agent topic. Use the enhanced features of the Automotive Sales Concierge agent topic, now a part of the new Industries Sales Assistance agent template, to support more AI-assisted task automation and increase productivity of sales reps. Search for and select relevant accessories for a vehicle. Search for dealers that sell a particular vehicle and choose to capture the details as opportunity preferred seller records. Create a quote and add manual discounts as required.

Efficiently Manage Coverages for Proactive Customer Service

Improve proactive customer service by using the enhanced features of the Asset Service Estimation and Vehicle Service Estimation agent topics as part of the Asset Service Management agent. Efficiently select price books for a chosen service work type, the relevant products and their quantities. Choose to specify a different coverage for each product and simplify the process of incorporating asset warranties, entitlements, or service contracts. Create a more enriched quote with the specific discount details for each selected product. Create work orders with an asset's account ID and with the asset name and work type name in the subject.

Boost Sales Productivity with Industries Sales Assistance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Search for products and relevant accessories, find relevant dealers that sell them, create a single opportunity for multiple selected products, and manage trade-in requests for assets with the Industries Sales Concierge agent topic. Use the enhanced features of the Automotive Sales Concierge agent topic, now a part of the new Industries Sales Assistance agent template, to support more AI-assisted task automation and increase productivity of sales reps. Search for and select relevant accessories for a vehicle. Search for dealers that sell a particular vehicle and choose to capture the details as opportunity preferred seller records. Create a quote and add manual discounts as required.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Automotive, Automotive Generative AI, Automotive Agents, Criteria-Based Search and Filter, Automotive Scheduler, Appraisal Management, and Automotive Components for Appraisal Management enabled.

Who: To use the Automotive Sales Concierge agent topic, users need the Criteria-Based Search and Filter, Automotive Scheduler, Partner Lead Management, and the Manage Appraisals and Valuations permission sets.

How: To give users the ability to manage vehicle sales for customers by using an AI agent, in Setup, on the Agentforce Agents page, click **New Agent**. Then, select the Industries Sales Assistance agent in Agent Builder.

To use the Automotive Sales Concierge topic, launch the Agentforce panel, and specify an utterance, such as *Show me valve caps for the customer vehicle* or *Find me a NeoGen LX with AWD Trim and 220 HP*.

Enable efficient Payment Deferral service process request intake through guided Omniscrypt forms for customers and service reps. Enhance lending processes with the Funding Workbench app for post-contract document review. Improve the dealer experience by simplifying document upload, task management, and communication for loan contract finalization.

Defer a Customer's Payments in a Single Flow

Streamline the intake and fulfillment of payment deferral requests for automotive loans or leases by using a prebuilt service process. Use the sample APIs to perform a customer's eligibility check and enroll them into the deferral program. Service reps can quickly initiate a service process request on behalf of customers by using the Payment Deferral template from Unified Catalog, improving customer service quality and reducing turnaround time. They can also initiate a request through the Asset Finance Management agent. Furthermore, customers can access the Omniscrypt-based form on the Experience Cloud site and log a request to defer payments due to unforeseen circumstances.

Optimizing Automotive Loan Funding with Funding Workbench

Enhance your Automotive lending process with the Funding Workbench console by managing post-contract document reviews. The Funding Workbench console provides a single location for funding analysts to view all the required documents uploaded by dealers, execute and assign related tasks to finalize the funding for a customer's loan or lease. They can also upload and associate relevant documents with action items for dealers to work on missing requirements. Optimize task and workflow management system while fostering seamless collaboration between stakeholders.

Execute Post-Contract Review Tasks from Dealer Portals

Increase efficiency of automotive loan contracting processes and improve partner experience. Dealers can easily upload documents required for loan or lease contracts by using the Funding Workbench console on an Experience Cloud site. Post review of the contract terms from a funding analyst, dealers can view the tasks or sub-tasks assigned to them with simplicity and fulfill the missing requirements and help finalize the funding for a customer's loan or lease.

Defer a Customer's Payments in a Single Flow

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Store the associated product service campaign definition partner inventory.

Use the new field Product Service Campaign Definition Partner Inventory on Return Order.

New Objects

Represent the production batch details for a product campaign definition item.

Use the new Product Service Campaign Definition Production Batch object.

Represent information about dealerships selling and, or, servicing products for location-based searches. Helps customers find nearby dealer locations for purchasing products and product-related services.

Use the new Dealer Product Searchable Field object.

Represent the association of document checklist items for an application action item and is used to track the status of document checklist items with respect to an application action item.

Use the new Application Action Item Document Checklist Item object.

Channel Revenue Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve partner collaboration with Stock Rotation Incentives by managing returns or scrapping unsold stock for incentives. Manage incentive spending by defining, allocating, and tracking budgets across stock rotation, standard rebates, ship and debit, and price protection programs. Enhance financial reporting with subledger integration by recording rebate claims and payouts in your Accounting Subledger.

Strengthen Partner Collaboration with Stock Rotation Incentives

Facilitate manufacturer–partner collaboration by enabling structured product returns or scrap of unsold stock in exchange for incentives. Promote timely replacement of aging inventory by defining programs with allocated partner budgets. Streamline operations by integrating partner submission, eligibility validation, claim creation, and budget tracking into a single incentives framework.

Manage Incentive Budgets to Drive Financial Accountability

Gain visibility into incentive spending by defining, allocating, and tracking budgets across stock rotation, standard rebates, ship and debit, and price protection programs. Ensure budget availability for payouts, prevent overspending, and align financial commitments with program rules. Set total budget amounts manually and allocate budgets across partners or member types. Track budget consumption to manage program spend and maintain visibility into financial liabilities.

Enhance Financial Reporting with Subledger Integration

Improve financial reporting by integrating rebate claims and rebate member payouts with your accounting subledger. This integration ensures accurate recording and accounting-ready formatting of financial transactions for rebate programs.

Simplify Feature Discovery and Setup

Salesforce Go now supports a broader range of partner engagement features that you can configure and manage from a single location in Setup. Implement features faster, reduce context switching, and simplify setup across your org.

New and Changed Objects for Channel Revenue Management

Standardize processes and streamline workflows with a new suite of common components in Agentforce Communications, formerly Communications Cloud. These modular tools integrate into your architecture, helping you expand across verticals without requiring add-ons.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Agentforce Communications.

Why: You can use any of these common components that integrate into your existing environment.

- Action Plans – Capture repeatable business tasks using templates.
- Advanced Program Management – Simplify daily tasks for agencies and institutions.
- Care Plans – Track goals, benefits, and individual milestones.
- Case Referrals – Connect individuals with services via referral requests.
- Complaints Management – Document incidents regarding health, safety, or behavior.
- Compliant Data Sharing – Monitor data sharing for regulatory compliance.
- Decision Explainer – Explain why business rules generated specific results. (Available on Salesforce Platform only)
- Document Checklist Items – Track and approve customer-submitted documents.
- Dynamic Assessments – Streamline data capture for inspections and evaluations.
- Group Membership & Households – Organize relationships between people and groups.
- Interaction Summaries – Capture detailed notes with confidentiality controls.
- Interest Tags – Track customer needs and prospecting opportunities.
- Outcome Management – Measure program impacts and initiative results.
- Rollup – Aggregate records from various objects efficiently.

Enterprise Sales Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve quote clarity and workflow efficiency with new controls. Manage larger orders and link cloned

quotes directly to opportunities. Protect your data by retaining original pricing and confirming line item deletions.

Associate Cloned Quotes with New or Existing Opportunities

Associate a cloned quote with a different existing opportunity or a newly created one directly within the cloning workflow and eliminate manual re-association steps for your sales team. Previously, sales reps had to clone a quote and then manually re-associate it with the correct opportunity in a separate step. Consolidating these actions streamlines the sales process and reduces data entry errors.

Retain Original Asset Pricing During Modifications

Preserve original asset prices during Move, Add, Change, Delete (MACD) operations in Enterprise Sales Management by defining attributes in Industries CPQ. Now, pricing calculations run only when you modify a price-impacting attribute, such as a manual override, applied discount, or quantity change. Updates to non-price attributes no longer trigger automatic repricing. Industries CPQ identifies these attributes via attribute-based pricing.

Prevent Unnecessary Action Status Updates During MACD Operations

Preserve the Existing status on asset line items when Move, Add, Change, Delete (MACD) rules update attribute properties without altering the actual values. Industries CPQ compares the original and current values so that only actual data modifications trigger a Change status. Previously, both value modifications and metadata changes triggered a status update to Change.

Accelerate Sub-Order Creation with Scaled Batch Sizes

Streamline your quote-to-order process by using scaled batch sizes to generate sub-orders faster within Enterprise Sales Management. Enable your sales reps to convert high-volume quotes efficiently while maintaining system stability and staying within query limits.

Confirm Deletion of Quote Line Items in the Summary Tab

The Summary tab prompts for confirmation when you delete a Quote Line Item in an Enterprise Sales quote. This step prevents accidental removal and confirms that the deletion is intentional.

View Placeholders for Hidden Attributes in Enterprise Sales Quotes

Get immediate context regarding attribute visibility in the Enterprise Sales Quote interface. When catalog configuration rules hide attributes, a placeholder UI label now appears rather than the fields disappearing. This UI label helps sales reps focus on customer-relevant data during the quoting process.

Process Large Enterprise Quotes with Enhanced Stability

Manage your large enterprise deals with a robust, optimized processing engine. Your sales reps can execute bulk Move, Add, Change, Delete (MACD) operations without timeouts or system instability. High-volume datasets previously caused transaction failures and governor limit errors, leading to breakdowns in the quoting workflow.

Associate Cloned Quotes with New or Existing Opportunities

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Revenue Cloud for Communications on Salesforce Platform

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Discover, set up, and configure Revenue Cloud for Communications features with Salesforce Go. Boost your customer acquisition and revenue by applying customizable promotions to quotes and orders during configuration. Learn more about these and other enhancements in Revenue Cloud for Communications.

Communications Cloud Sales Is Now Revenue Cloud for Communications

We have updated product documentation and in-app wording to reflect the renaming of Communications Cloud Sales to Revenue Cloud for Communications. This name change doesn't affect the functionality of Revenue Cloud for Communications. During the naming transition, the old name

might still appear in some Salesforce resources.

Simplify Revenue Cloud for Communications Feature Configuration and Setup

With Salesforce Go, you can discover, set up, configure Revenue Cloud for Communications features, and track feature usage, all from a single location in Setup. Learn more about features and get help with configuration by accessing content resources and links. Explore more Revenue Cloud for Communications products and features from Salesforce Go.

Refine User Access with a New Permission Set

Simplify permission management by granting precise access to Revenue Cloud for Communications features. The Comms Sales Features permission sets are scheduled for deprecation. To maintain access to the necessary flow, connect APIs, and multisite features, use the Revenue Cloud for Communications Features permission set.

Promotions in Revenue Cloud for Communications

Use promotions to help businesses influence buying decisions and accelerate growth. Sales reps can view and apply promotions to quote and order during configuration in the Transaction Line Editor, and see real-time price adjustments reflecting discounts in the price waterfall. Sales reps can view applied promotions on assets, and amend, renew, and cancel products that have promotions. These capabilities offer greater control and efficiency in managing sales and revenue strategies.

Use promotions to help businesses influence buying decisions and accelerate growth. Sales reps can view and apply promotions to quote and order during configuration in the Transaction Line Editor, and see real-time price adjustments reflecting discounts in the price waterfall. Sales reps can view applied promotions on assets, and amend, renew, and cancel products that have promotions. These capabilities offer greater control and efficiency in managing sales and revenue strategies.

[Apply Promotions to a Quote and an Order to Boost Sales](#)

Enhance your sales strategy with configurable promotions. Easily configure promotion details, including type, duration, and eligibility, and add coupons for manual promotions. View and apply tailored promotions to a quote and an order directly from the configurator or the Transaction Line Editor to acquire new customers or deepen relationships with existing ones. Your sales team has the flexibility to close every deal with the best offer. You can also apply manual promotions on the quote and order record page.

Quickly Create Orders from a Quote with Promotions

Enhance the efficiency of sales reps by automating the creation of orders from a quote with promotions based on different criteria, such as recipients, fields, or groups.

Simplify Subscription Changes for Products with Promotions

Help your sales reps support existing customers by making it easy to update products with active promotions when a customer wants to make changes. Sales reps can handle products efficiently and accurately during amendment, renewal, and cancellation of products that have active promotions. This capability ensures that customers can amend, renew, or cancel products that have promotions, providing a frictionless experience for sales reps.

Consumer Goods

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Optimize retail execution with AI-driven insights in Consumer Goods Cloud with Retail Execution Visit Assistant. Streamline field operations for users with visit, order, and document cancellation. Prevent duplication of listing classification records with enhanced checks, and improve tour management with new and updated data objects. Diagnose and optimize sync performance using Named Query Analyzer. Generate professional documents with improved PDF previews, custom dimensions, and global date formats. Capture inventory actuals and streamline synchronization with the automatically installed TPM Data Connector. Set up certain Consumer Goods features from a single location through Salesforce Go.

Agentforce for Consumer Goods

Retail Execution Visit Assistant now offers data-driven insights on account performance and product upsell opportunities to boost sales and efficiency. Sales reps can get immediate, AI-powered assistance directly within their mobile app, providing quick access to account summaries or product details.

Retail Execution

Field users can cancel uncompleted visits, orders, and documents on the field. Prevent record duplication and improve data accuracy with enhanced checks for listing classifications. Enhance your retail execution capabilities with new and updated data objects for better tour and route management.

Sync Management

Sync performance evaluation is simplified with the new Named Query Analyzer tool. Sales reps can now manage Case and Order objects directly in the Consumer Goods Cloud mobile app in online and offline modes.

Visual Studio Code Based Modeler

Create detailed, well-formatted documents with improved readability and flexibility of PDF previews and printed documents for your users. Define custom page dimensions and configure correct date formats to ensure that documents are tailored to specific business needs and global audiences.

Trade Promotion Management

Get better visibility of financial metrics throughout promotion planning and execution phases by writing back accrual amounts into tactic funds. Enhance engine capabilities by supporting accrual

calculations for tiered tactics and growth programs. Help centralize data for advanced sales and promotion analysis by integrating Trade Promotion Management data with Data 360.

Manage Consumer Goods Cloud Features in One Place

With Salesforce Go, discover, set up, configure, and track a selection of Consumer Goods Cloud features. Access content resources and links for more information and configuration help, all from one location in Setup.

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Your sales reps can now get help from agents directly in their Consumer Goods Cloud mobile app. They can chat with agents to get account summaries, product recommendations, or promotion details.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud Retail Execution.

Why: Your sales reps handle multiple tasks during store visits, from dealing with limited visibility into sales data to time-consuming order entry. This integration gives sales reps direct access to agentic capabilities, enhancing their productivity and helping with decision-making.

How: In Setup, turn on the **Retail Execution** setting, and in Sync Settings, enable the **Integrate Agentforce in CG mobile app** setting. Configure the desired agent topics and actions in Salesforce. Admins.

Sales reps restart their Consumer Goods Cloud mobile app and launch the agent by tapping the agent icon on the mobile app page header. If there are multiple agents, you can choose your preferred one from the list and start interacting with it. You can:

- Request summary of specific account.
- Request product recommendations for a particular account.
- Ask for the promotions for a specific product.
- Request a visit summary with key details in one view.

Retail Execution

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Field users can cancel uncompleted visits, orders, and documents on the field. Prevent record duplication and improve data accuracy with enhanced checks for listing classifications. Enhance your retail execution capabilities with new and updated data objects for better tour and route management.

Cancel Visits, Documents, and Orders on the Mobile App

Give hybrid users and drivers the ability to cancel visits, orders, and delivery documents from their mobile device. Reduce manual communication when external factors, such as traffic, payment issues, or inventory problems, prevent the completion of a visit or order. Configure cancellation reason and geolocation tracking requirements to maintain audit trails for field operations.

Experience Zero-Touch Voice-Activated Capabilities in Consumer Goods Cloud Mobile App

Give your sales reps a hands-free experience with voice-activated notes, powered by speech-to-text integration, even when they're offline. Additionally, they can use their voice to capture survey data or update orders in the app using speech-to-text and prompt template APIs when they're online.

Maintain Listing Classification Data Integrity

The Listing Module on the New Listing Classification page is now a picklist that matches the entries on the Edit page. When your users create or update listing classifications the user experience is consistent. To prevent duplicate records, the application also checks for unique combinations of Product Category and Listing Module for an account.

New and Changed Objects for Retail Execution

Do more with the new and changed Retail Execution objects.

Cancel Visits, Documents, and Orders on the Mobile App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give hybrid users and drivers the ability to cancel visits, orders, and delivery documents from their mobile device. Reduce manual communication when external factors, such as traffic, payment issues, or inventory problems, prevent the completion of a visit or order. Configure cancellation reason and geolocation tracking requirements to maintain audit trails for field operations.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud Retail Execution.

Who:

- To set up cancellation reasons and geolocation tracking through the Consumer Goods Cloud desktop app, you need the Direct Store Delivery for Consumer Goods Cloud Offline Mobile App permission set.
- To cancel visits, orders, and documents on the Consumer Goods Cloud mobile app, drivers need the CGCloud Tour Driver permission set, OR the (CGCloud Retail Tour Driver AND CGCloud Retail User) permission sets.
- Hybrid users need all the permission sets required for the hybrid user persona. See [Permission Sets From Summer '24](#).

How: In the Visit template, select **Cancel Reason Required** and **Location Capture During Cancel**. In the Order template, select **Cancel Reason Required**.

Experience Zero-Touch Voice-Activated Capabilities in Consumer Goods Cloud Mobile App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your sales reps a hands-free experience with voice-activated notes, powered by speech-to-text integration, even when they're offline. Additionally, they can use their voice to capture survey data or update orders in the app using speech-to-text and prompt template APIs when they're online.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud Retail Execution.

How: Customizers configure these new methods in the business logic layer:

- `launchSpeechToTextAsync` - Integrates the speech-to-text interface in the Consumer Goods Cloud mobile app.

- `executePromptTemplateAsync` - Calls the prompt template service to generate prompt text.

Maintain Listing Classification Data Integrity

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Listing Module on the New Listing Classification page is now a picklist that matches the entries on the Edit page. When your users create or update listing classifications the user experience is consistent. To prevent duplicate records, the application also checks for unique combinations of Product Category and Listing Module for an account.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud Retail Execution.

How: If you're upgrading to the Consumer Goods Cloud Spring '26 managed package, apply the page layout changes listed in [New and Changed Objects for Retail Execution](#).

New and Changed Objects for Retail Execution

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with the new and changed Retail Execution objects.

New Objects

These objects are reserved for future use.

Object	Purpose
TimeSheet	This object is reserved for future use.

Object	Purpose
TimeSheetEntry	This object is reserved for future use.

Page Layout Changes

If you're upgrading to the Consumer Goods Cloud Spring '26 managed package, manually make these page layout changes.

Existing Page Layout	Object	Related List	Change Description
Customer Layout	Account	Listing Classifications	In the Buttons section, deselect New from Standard Buttons. Select the New button from the Custom Buttons.

Custom Setting Changes

If you're upgrading to the Consumer Goods Cloud Spring '26 managed package, upload the `System_Setting_-_NEW_260.csv` static resource file to get the new custom system setting. See [Salesforce Help: Additional Steps to Upgrade Managed Packages to Spring '26](#) (can be outdated or unavailable during release preview).

New Custom Setting	Usage
Account_Visit_History_Visit_Types	Specifies the types of visits to retrieve from the Get Retail Execution Visits By Account Agentforce action.

Static Resource File Changes

For changes to static resources, see [Salesforce Help: Additional Steps to Upgrade Managed Packages to Spring '26](#) (can be outdated or unavailable during release preview).

Sync Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Sync performance evaluation is simplified with the new Named Query Analyzer tool. Sales reps can now manage Case and Order objects directly in the Consumer Goods Cloud mobile app in online and offline modes.

Diagnose Sync Performance Easily with Named Query Analyzer

Get a clear view of the execution of complex named queries and the handling of large data volumes in the Named Query Analyzer tool. Admins can use this tool to spot sync configuration issues and take steps to resolve them.

Manage Orders and Cases Offline in Consumer Goods Cloud Mobile App

Customizers can build offline scenarios using objects with names as reserved keywords such as, Case. Sales reps can add and edit Case and Order objects directly in the Consumer Goods Cloud mobile app, even in offline mode. Sales reps can also address customer issues and process orders during store visits.

Diagnose Sync Performance Easily with Named Query Analyzer

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get a clear view of the execution of complex named queries and the handling of large data volumes in the Named Query Analyzer tool. Admins can use this tool to spot sync configuration issues and take steps to resolve them.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud.

How: To show the NQ Analyzer button in the application, turn on the **Display Named Query Analyzer Tool** setting in Sync Settings. From the Sync Configuration tab, click Named Queries. On the Named Queries page, click **NQ Analyzer**. On the Named Query Analyzer page, review the hierarchy of named queries and the number of SOQL queries that were run for the named query. You can run queries for a specific user context or client app ID. Click a named query tree to open a detailed view of how the query was run.

Manage Orders and Cases Offline in Consumer Goods Cloud Mobile App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Customizers can build offline scenarios using objects with names as reserved keywords such as, Case. Sales reps can add and edit Case and Order objects directly in the Consumer Goods Cloud mobile app, even in offline mode. Sales reps can also address customer issues and process orders during store visits.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud.

Visual Studio Code Based Modeler

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create detailed, well-formatted documents with improved readability and flexibility of PDF previews and printed documents for your users. Define custom page dimensions and configure correct date formats to ensure that documents are tailored to specific business needs and global audiences.

Customize Page Dimensions and Styles in Print Layout

Design custom page dimensions and override default formatting by using the styles node. The style designed for a paragraph applies to all paragraph elements in the print layout. You can set the style name to paragraph, table, and headings. Specifying attributes such as font size, margin, bold, and italics is optional.

Other Improvements in Visual Studio Code Based Modeler

The PDF preview now automatically splits content pages, improving readability without affecting thermal printing. Adapt page layout rules to append more columns and apply center alignment. Configure day and year values in correct formats for all supported languages.

Customize Page Dimensions and Styles in Print Layout

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Design custom page dimensions and override default formatting by using the styles node. The style designed for a paragraph applies to all paragraph elements in the print layout. You can set the style name to paragraph, table, and headings. Specifying attributes such as font size, margin, bold, and italics is optional.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Einstein 1, and Agentforce 1 editions with Consumer Goods Cloud.

How: Adapt PrintLayout V2 contracts with page dimensions or custom sizes with these standard formats - A4 (default), A5, EXECUTIVE, FOLIO, LEGAL, LETTER, and TABLOID. You can now define pageSize with an array of width and height in points, where 1 inch = 72 points. For example, `pageSize="[216, auto]"`.

Customize or modify the default formatting in your print layouts with the `styles` node.

```
...
<ReportLayout pageMargins="[5,5,5,5]" pageSize="[216, auto]">
  <styles>
    <style name="paragraph" fontSize="12" bold="true" />
    <style name="tableBody" margin="[0,2,0,2]" italics="true" />
  </styles>
...
```

The styles node configuration isn't supported for Bluetooth thermal printers.

Other Improvements in Visual Studio Code Based Modeler

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The PDF preview now automatically splits content pages, improving readability without affecting thermal printing. Adapt page layout rules to append more columns and apply center alignment. Configure day and year values in correct formats for all supported languages.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions with Consumer Goods Cloud.

Why: Visual Studio Code Based Modeler offers these enhancements.

- PDF preview readability with auto-spilt pages: Content is now automatically split into pages in the preview. Previously, all content appeared on a single page when the PDF height was set to `auto` for 3-inch Bluetooth thermal printers. This change makes it easier to read in the preview without affecting the actual thermal printing. See [Considerations and Guidelines for Bluetooth Thermal Printer and Print Layout Setup](#).
- Page layout rules and text alignment: Add more columns to your 3-inch PDF prints to create detailed and readable documents. You can set the minimum width requirement for `<th>` elements in the print layout upto 8%. You can also center align `<th>` elements. See [Considerations and Guidelines for Bluetooth Thermal Printer and Print Layout Setup](#).

- International formatting in date selection - Configure the `PickerDaySuffix` and `PickerYearSuffix` attributes in your locale contract to show day and year values in correct format in the date wheel for all supported languages. See [Localize Date, Time, and Numbers](#) and [DatePicker UI Control](#).

For example, design your documents to cater to languages like Japanese that require "年" (Year) and "日" (Day) characters alongside numeric values.

```
<PickerDaySuffix value="日"/>
<PickerYearSuffix value="年"/>
```

Trade Promotion Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get better visibility of financial metrics throughout promotion planning and execution phases by writing back accrual amounts into tactic funds. Enhance engine capabilities by supporting accrual calculations for tiered tactics and growth programs. Help centralize data for advanced sales and promotion analysis by integrating Trade Promotion Management data with Data 360.

Get Accrual Data Directly in Tactic Funds

Configure the write-back of accrual amounts into tactic funds. The aggregated accrual output is updated in the tactic fund to inform the key account manager of what the current accrued liabilities and other financial metrics are.

Get Accurate Financials for Tier Tactics and Growth Programs

Key account managers (KAMs) can calculate accruals for tier tactics and growth programs. Accrual calculations for tier tactics provide KAMs with an accurate picture of liabilities throughout the entire promotional lifecycle.

Integrate Trade Promotion Management Data with Data 360 for Enhanced Insights

Enhance visibility into Trade Promotion Management (TPM) writeback KPIs in Data 360 by centralizing your data. Get a comprehensive view of product sales, promotion impact, and business trends by analyzing TPM data alongside external B2B and B2C data. Easily access and validate the writeback KPI data within Data 360.

Customize the Trade Calendar and Account Plan Views with Smart UI Enhancements

Give your key account managers a more focused user experience by customizing the promotion phases that appear in the trade calendar and account plan views based on their sales organization. Meet specific market needs and business requirements by defining the type of product selection available for each sales organization.

Choose Which Promotion Fields to Show in a Customer Business Plan

Show only the relevant fields on the Promotions tab to help key account managers focus on the data they need to analyze a promotion or hide the page entirely. The account manager can select a promotion link to go to the promotion's page. Translate the field labels in any Salesforce-supported language.

New and Changed Objects in Trade Promotion Management

Do more with the new and changed Trade Promotion Management objects. Changes span across areas such as fields, page layouts, and picklist values related to configuring Promotion tab for Customer Business Plans and other features.

Changed APIs in Trade Promotion Management

Do more with the changed APIs in v66 and later.

Get Accrual Data Directly in Tactic Funds

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Configure the write-back of accrual amounts into tactic funds. The aggregated accrual output is updated in the tactic fund to inform the key account manager of what the current accrued liabilities and other financial metrics are.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions with Trade Promotion Management and Data 360.

How: In the Tactic Template for accrual-relevant tactics, turn on writing-back of accrual amounts.

Get Accurate Financials for Tier Tactics and Growth Programs

Show only the relevant fields on the Promotions tab to help key account managers focus on the data they need to analyze a promotion or hide the page entirely. The account manager can select a promotion link to go to the promotion's page. Translate the field labels in any Salesforce-supported language.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions with Trade Promotion Management and Data 360.

How: In the Customer template, select whether to show the Promotion tab. Add or delete fields in the component.

New and Changed Objects in Trade Promotion Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with the new and changed Trade Promotion Management objects. Changes span across areas such as fields, page layouts, and picklist values related to configuring Promotion tab for Customer Business Plans and other features.

Field Changes

If you're upgrading to the Consumer Goods Cloud Spring '26 managed package, make sure your users have edit access for them to prevent any sync errors.

Existing Object	New Field	Purpose
cgcloud__Account_Template__c	Has_Promotions_in_Business_Plan__c	Determines whether the Promotions tab is shown in customer business plans. Possible values: - Enabled: This is the default value. - Disabled
cgcloud__Sales_Organization__c	Product_Definition_Policy__c	Specifies the method to add products to trade calendar and account plan. Possible values: - Dynamic - Static
cgcloud__Sales_Organization__c	Promotion_Phases__c	Specifies the promotion phases shown in trade calendar and account plan filters. Uses global value set Promotion_Phases.
cgcloud__Tactic_Template__c	Use_Accrual_Output_For_Fund_Liability__c	Determines whether accrual outputs are considered when liabilities are calculated for tactics and tactic funds.

Field Set Changes

If you're upgrading to the Consumer Goods Cloud Spring '26 managed package, the field sets are automatically added with the new fields.

Existing Object	Displayed Fields	Existing Field Set	Purpose
cgcloud__Promotion__c	Name Slogan__c Date_From__c Date_Thru__c	cgcloud__CBP_Tab	Lists the fields shown in the Promotions tab of the customer business plans.

Existing Object	Displayed Fields	Existing Field Set	Purpose
	Phase__c KPI_Value_1__c KPI_Value_2__c KPI_Value_3__c Participate_In_Active_Account_Plan__c Relevant_For_Account_Plan__c		

Page Layout Changes

Existing Page Layout	Object	Fields Name	Change Description
Account Template Layout	cgcloud__Account_Template__c	cgcloud__Has_Promotions_in_Business_Plan__c	Added a new field to the layout.
Promotion Template Kpi Definition Layout	cgcloud__Promotion_Template_Kpi_Definition__c	KPI_Definition__c Usage__c	Changed the required access for the KPI Definitions and Usage fields from Readonly to Required.
Sales Organization Layout	cgcloud__Sales_Organization__c	Promotion_Phases__c Product_Definition_Policy__c'	Added two new fields to the layout.
Tactic Template Layout	cgcloud__Tactic_Template__c	Use_Accrual_Output_For_Fund_Liability__c	Added a new field to the layout.

Picklist Value Changes

Add new picklist values to activate new features, as they are not automatically upgraded when you upgrade the Consumer Goods Cloud managed packages.

To make use of the new picklist value, add it to the specified field and record types.

Existing Objects	Existing Picklist Field	New Picklist Values	Purpose
cgcloud__RTR_Report_Configuration__c	Usage__c	datacloudpromotionmeasuresmeta datacloudaccountplanmeasuresmeta	Includes the usage types for report configuration.

Changed APIs in Trade Promotion Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Discover the power of Financial Services Cloud, which uses AI to unify customer data from banking, wealth, and insurance platforms. Financial Services Cloud enables personalized engagement, faster onboarding, and improved customer loyalty with industry-specific automation and AI-powered services. With trusted AI, the platform delivers intelligent insights for financial planning, helping customers achieve financial success.

Financial Services Cloud is now Agentforce Financial Services. You may see references to Financial Services Cloud in our application and documentation.

[Agentforce for Financial Services](#)

Scale your team by using agents for Financial Services to deliver outstanding client experiences.

[Accelerate Setup with Salesforce Go](#)

Salesforce Go expands its support for Agentforce Financial Services, formerly Financial Services Cloud, introducing a single setup location for all key features. Discover Digital Lending capabilities on

Salesforce Go and take advantage of expanded configurability across all Agentforce Financial Services features for a more tailored implementation experience.

Advanced Document Validation

Improve document validation by defining specific fields for each document checklist item, reducing user friction and increasing accuracy across related records.

Flexible Hierarchies

Create hierarchies to visualize complex business relationships with customers and partners. Use the insights to drive strategic innovations and scale operations across your business.

Complaint Management

Accelerate complaint resolution and mitigate risk with immediate Slack and email alerts for priority cases.

Digital Lending

Accelerate intermediary firm registration with automated due diligence and verification workflows for digital lending. Streamline intermediary employee onboarding with automated approvals that grant compliant access and permissions instantly. Enable intermediary loan originators to submit and track applications using guided tools, reducing errors and processing delays.

Service Process Automation

Use the prebuilt financial service process templates to help you get started. Upgrade the service process self-service experience for customer community users with the enhanced Financial Services Client Portal template. From AI-generated knowledge summaries to context-aware quick chats and service processes catalog, deliver intelligent, connected support experiences with ease.

Transaction Dispute Management

Capture complete details for automated clearing house (ACH) disputes with a guided questionnaire. Submit disputes for unlisted transactions, and retain your selections as you move through the intake form. Speed up the Mastercard® dispute stage setup process with a preconfigured stage definition template.

Use More Agentforce Financial Services Objects with Data Cloud

Unify client data across channels by ingesting Lead, Case, and Financial Account Transaction objects from Financial Services Cloud into Data Cloud.

New Agentforce Financial Services Jumpstart Bundles

Quickly get started with Agentforce Financial Services, formerly Financial Services Cloud, by using preconfigured features and flows designed to reduce setup time and complexity.

New and Changed Agentforce Financial Services Objects

Do more with new and updated Agentforce Financial Services, formerly Financial Services Cloud, objects.

New Connect REST API for Flexible Hierarchies

Ensure your flexible hierarchies are in Draft status and meet data model constraints before processing.

New and Enhanced Common Features for Agentforce Financial Services

Agentforce Financial Services, formerly Financial Services Cloud, includes access to some features that are available across clouds and products in Industries. Use these features to extend and customize

Agentforce Financial Services based on your business needs.

- [Action Plans and Events and Milestones](#)

Customize the quick actions on an action plan template record page. Include document checklist items in actions plans for financial accounts. Learn about the life events in a client's household at a glance.

- [Collections and Recovery](#)

Boost cash flow and reduce bad debt with outbound dialer campaigns.

- [Discovery Framework](#)

Streamline multilingual customer assessments by presenting forms in the user's preferred language, ensuring compliance and maintaining historical data accuracy. Map responses to specific question versions for consistency. Use natural language instructions to efficiently create and refine assessment questions with Agentforce.

- [Process Compliance Navigator](#)

Use Process Compliance Navigator to ensure your organization meets regulatory requirements, internal policies, and industry standards. Compliance governance is strengthened with new validation criteria enforcing auditable transitions for controls, regulations, and policies, ensuring consistent evidence. Efficiency is improved by using context definitions for streamlined data access in validation and Compliant Data Sharing for records.

Agentforce for Financial Services

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Scale your team by using agents for Financial Services to deliver outstanding client experiences.

[Banking Service Customer Assistance](#)

Use the Agentforce Banking Service Customer Assistance agent template to create agents that serve your banking customers across multiple channels. Resolve inquiries faster by connecting with customers on voice, WhatsApp, and third-party websites.

[Financial Advisor Assistance Agent for FSC Managed Package](#)

Modernize wealth advisor workflows within Financial Services Cloud Managed Package by using the FinServ Package Financial Advisor Assistance Agent, which automates routine tasks and delivers AI-driven insights from client portfolios and market trends.

Banking Service Customer Assistance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the Agentforce Banking Service Customer Assistance agent template to create agents that serve your banking customers across multiple channels. Resolve inquiries faster by connecting with customers on voice, WhatsApp, and third-party websites.

Transform Digital Customer Experience with Agentforce Banking Service Customer Assistance

Support your customers with an AI-powered self-service that autonomously creates cases for banking inquiries and helps them with their queries. The agent securely verifies customer identity to access sensitive account information. This integrated verification helps customers complete tasks without switching screens. For complex service requests, the agent conversationally escalates the interaction to live service representatives with full context.

Engage Banking Customers on WhatsApp

Your customers can securely raise requests for banking services on WhatsApp. Route banking customer inquiries from WhatsApp to the Agentforce Banking Service Customer Assistance agent with the prebuilt Route Messaging Session to Banking Service Agent Omni-Channel flow. Offer quick resolution to reduce friction and call volume by meeting customer demands where they communicate daily.

Extend Banking Support to Third-Party Websites

Use a prebuilt flow to route banking service inquiries from third-party websites or your bank's secure internet portal to the agent. Embed the Agentforce Banking Service Customer Assistance agent to securely manage interactions for guest users, recognize logged-in users, and initiate customer authentication on third-party websites.

Resolve Banking Inquiries Faster with Voice Support

Use Agentforce Voice to provide secure, intelligent 24/7 phone support for banking customers. The voice-enabled agent handles routine tasks by using natural language instructions and spoken OTP verification, escalating complex financial calls to live staff conversationally.

Enhance Transaction Inquiries with Natural Language

Help your users find transactions by using natural language. The updated Get Transaction agent action now uses LLMs (Large Language Models) to understand complex, multilayered requests. For example, users can ask for "all debits over \$500 from the last month". In addition, with three new Lightning Web Components, the agent can show financial accounts, balances, and transactions more clearly in the Agentforce Banking Service Employee Assistance console and Banking Service Customer Assistance chat interface.

Transform Digital Customer Experience with Agentforce Banking Service Customer Assistance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Support your customers with an AI-powered self-service that autonomously creates cases for banking inquiries and helps them with their queries. The agent securely verifies customer identity to access sensitive account information. This integrated verification helps customers complete tasks without switching screens. For complex service requests, the agent conversationally escalates the interaction to live service representatives with full context.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Agentforce Financial Services, formerly Financial Services Cloud. The Agentforce Service agent uses Flex Credits under the Salesforce Foundations Entitlements model.

Note Fee Reversal Request agent topic in Banking Service Customer Assistance is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and the applicable terms, such as Non-GA Agentforce, Non-GA Open AI LLM Provider, and Non-GA Credit Consumption in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion. The Non-GA Services are used in conjunction with GA Services which consume paid credits or entitlements ("entitlements"). Any corresponding consumption of entitlements arising from Customer's use of the Non-GA Services shall not give rise to any refund or credit rights.

Who: To use the Banking Service Customer Assistance template and agent topics, users need these permission sets and permission set licenses.

- Salesforce Foundations Standard permission set
- Industry Service Excellence permission set
- Financial Services Cloud Extension, Financial Services Cloud Basic, Financial Services Cloud Service, or Financial Services Cloud Standard permission set license
- Omnistudio User permission set
- Business Rule Engine Runtime permission set

Why: Use the prebuilt agent topics included in the Banking Service Customer Assistance template.

- **Address Update Request:** Helps customers update their account-related and financial account-related addresses. Identifies and selects the specific address to change, gathers the new details, and creates a case for the update.
- **Financial Account Statement Request:** Helps customers request copies of checking or savings account statements. Collects details regarding the specific account, statement period, and delivery method, and creates a case for fulfillment.
- **Financial Account Balances Request:** Helps customers view the financial account balances associated with a specific account. Identifies the relevant financial account, and provides current details such as available and total balances.
- **Financial Account Transactions Request:** Helps customers identify the relevant account, and shows the history including deposits, withdrawals, and payments.

- **Card Lock Management Request:** Captures customers requests to lock or freeze a card temporarily or to unlock or reactivate a previously locked card.
- **Funds Transfer to Own Account Request:** Helps customers set up one-time or recurring fund transfers between savings and deposit accounts, including loan and credit card payments. Collects necessary payment details, and creates a case for the fund transfer.
- **Report Credit or Debit Card Request:** Helps customers report their credit or debit card as lost, stolen, destroyed, or captured by an ATM. Shows the necessary card details, and creates a case to block the card to prevent unauthorized use.
- **Fee Reversal Request (beta):** Helps customers reverse the fees charged to their financial accounts. Assists in identifying the specific transaction to reverse by showing relevant details, and submits the reversal request for processing.

How: To get started with Agentforce banking service for customers, complete the setup and configuration for Banking Service Customer Assistance topics. Then, from Setup, turn on Einstein generative AI from the Einstein setup page and Agentforce. Next, to set up a Banking Service Customer Assistance agent, on the Agentforce Agents setup page, click **New Agent**. Then, select the **Banking Service Customer Assistance** template in the Agent Builder.

Engage Banking Customers on WhatsApp

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Your customers can securely raise requests for banking services on WhatsApp. Route banking customer inquiries from WhatsApp to the Agentforce Banking Service Customer Assistance agent with the prebuilt Route Messaging Session to Banking Service Agent Omni-Channel flow. Offer quick resolution to reduce friction and call volume by meeting customer demands where they communicate daily.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Agentforce Financial Services, formerly Financial Services Cloud. The Agentforce Service agent uses Flex Credits under the Salesforce Foundations Entitlements model.

Who: To use the prebuilt Route Messaging Session to Banking Service Agent Omni-Channel flow for the Banking Service Customer Assistance template, users need these permission sets and permission set licenses:

- Salesforce Foundations Standard permission set

- Industry Service Excellence permission set
- Financial Services Cloud Extension, Financial Services Cloud Basic, Financial Services Cloud Service, or Financial Services Cloud Standard permission set license
- Omnistudio User permission set
- Business Rule Engine Runtime permission set

How: To connect the WhatsApp messaging channel to the agent, build an Omni-Channel flow by using the prebuilt Route Messaging Session to Banking Service Agent flow template. Configure WhatsApp messaging channel and associate the Omni-Channel flow by assigning the messaging queue. Set Double Opt-In Consent for WhatsApp Compliance and activate the channel.

Extend Banking Support to Third-Party Websites

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use a prebuilt flow to route banking service inquiries from third-party websites or your bank's secure internet portal to the agent. Embed the Agentforce Banking Service Customer Assistance agent to securely manage interactions for guest users, recognize logged-in users, and initiate customer authentication on third-party websites.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Agentforce Financial Services, formerly Financial Services Cloud. The Agentforce Service agent uses Flex Credits under the Salesforce Foundations Entitlements model.

Who: To use the prebuilt Route Third-Party Website Messaging Session to Banking Service Agent Omni-Channel flow for the Banking Service Customer Assistance template, users need these permission sets and permission set licenses:

- Salesforce Foundations Standard permission set
- Industry Service Excellence permission set
- Financial Services Cloud Extension, Financial Services Cloud Basic, Financial Services Cloud Service, or Financial Services Cloud Standard permission set license
- Omnistudio User permission set
- Business Rule Engine Runtime permission set

How: To connect the external site channel to the agent, build an Omni-Channel flow by using the prebuilt Route Third-Party Website Messaging Session to Banking Service Customer Assistance flow template. Configure Messaging Settings to generate the deployment snippet and embed the code into the website's HTML. Make sure to configure Allowed Domains (CORS and Trusted URLs) for secure connectivity and validate the integration through testing.

Resolve Banking Inquiries Faster with Voice Support

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Agentforce Voice to provide secure, intelligent 24/7 phone support for banking customers. The voice-enabled agent handles routine tasks by using natural language instructions and spoken OTP verification, escalating complex financial calls to live staff conversationally.

Note Voice conversations for Banking Service Customer Assistance is available only in English.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Agentforce Financial Services, formerly Financial Services Cloud, the Agentforce Service Agent add-on, Service Cloud Voice add-on, Universal Credit Metering, and Einstein for Financial Services add-on. Available in Salesforce orgs with Service Cloud Voice with Amazon Connect.

Why: Agentforce Voice is available with these Banking Service Customer Assistance agent topics: Address Update Request, Financial Account Statement Request, Financial Account Balances Request, Financial Account Transactions Request, Card Lock Management Request, Funds Transfer to Own Account Request, Report Credit or Debit Card Request, and Fee Reversal Request.

How: Create a voice-enabled agent by using the Banking Service Customer Assistance template in the Agent Builder. Next, add a telephony connection and configure its voice settings.

Digitally register your intermediary firm. Bring your intermediary firm's employees and loan officers onto your system quickly with an easy, role-based setup. Increase loan submission quality and speed. Enable intermediary loan officers to originate applications right in the partner portal.

Simplify Intermediary Firm Onboarding for Digital Lending

Speed up registration for intermediary firms with automated workflows for due diligence, verification, and approval. Track every step, document, and communication in one portal to keep the process transparent. Use integrations to check licenses and backgrounds, reducing manual work and risk. After approval, automatically set up the intermediary account and transfer employee management to the firm admin.

Automate Intermediary Employee Onboarding for Loans

Register intermediary employees by using an online form to trigger an automated approval process based on their role. Include Know Your Customer (KYC) and background checks to meet compliance requirements. Reduce manual work by automatically assigning permissions and granting access to loan application tools after approval.

Accelerate Loan Application Intake for Intermediary Employees

Help intermediary loan originators start new loan applications and view status directly in the Intermediary Portal. Guided workflows lead them through data entry and document uploads to ensure completeness and reduce errors. Lenders can monitor the application lifecycle from submission to underwriting and assign action items for follow-up. This shared visibility reduces inquiries to relationship managers and improves collaboration between partners and processing teams.

Use the prebuilt financial service process templates to help you get started. Upgrade the service process self-service experience for customer community users with the enhanced Financial Services Client Portal template. From AI-generated knowledge summaries to context-aware quick chats and service processes catalog, deliver intelligent, connected support experiences with ease.

Build Service Processes Faster with Prebuilt Templates in Unified Catalog

Access prebuilt financial service process templates in Unified Catalog and deploy them with a single click to include all associated data, metadata, and dependencies. While you can still create service processes in Service Process Studio, creating service process definitions from prebuilt templates is now unique to the Unified Catalog.

Speed Up Resolutions for Service Processes with Agentic Self-Service

Unify the customer self-service experience in the Financial Services Client portal template with new AI-powered components. Your users can view AI-generated summaries and the most common related questions, ranked by popularity, directly on a service process knowledge article page. Select a word or phrase in a service process knowledge article to trigger a quick chat that uses this context to provide context-aware answers. In addition, with the Associated Service Processes component, users can launch actions, such as order a checkbook, from relevant articles.

In addition, with the Associated Service Processes component, users can launch actions, such as order a checkbook, from relevant articles.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Agentforce Financial Services, formerly Financial Services Cloud, and the Agentforce Service Agent add-on.

Who: This feature is available to users with a Customer Community or Customer Community Plus license, and with a Knowledge license when accessing knowledge-related features. Site builders need the appropriate permissions to configure the Dynamic Q&A component in Experience Builder.

How: To generate article summaries and dynamic Q&A, turn on Service AI Grounding in Setup and configure the required prompt templates. For the Quick chat component to use your knowledge base, create a data library and assign it to the agent created by using Agentforce Service Agent template available in the Agent Builder. To display associated service processes, configure Unified Catalog Management (UCM) and associate knowledge articles with specific services.

Transaction Dispute Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Capture complete details for automated clearing house (ACH) disputes with a guided questionnaire. Submit disputes for unlisted transactions, and retain your selections as you move through the intake form. Speed up the Mastercard® dispute stage setup process with a preconfigured stage definition template.

Expand Your Dispute Intake to ACH Transactions

Collect detailed information from the start for Automated Clearing House (ACH) disputes. Extend the prebuilt guided dispute intake form to capture ACH disputes alongside card transactions. The intake form includes specific questions tailored for ACH cases to reduce data entry errors.

Increase Dispute Intake Flexibility for Service Representatives

Service representatives can now create transactions directly in the dispute intake form for immediate dispute submission. This flexibility expands dispute coverage to transactions that aren't available for selection, such as those transactions not yet recorded in the core banking system.

Accelerate Mastercard Dispute Stage Setup with a Prebuilt Template

Set up a compliant dispute process quickly by using the new stage management template for

Mastercard. The template auto-populates the stage definition with preconfigured steps and transitions. The steps automatically point to the correct Omniscrpts and integration definitions to eliminate manual mapping errors.

Expand Your Dispute Intake to ACH Transactions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Collect detailed information from the start for Automated Clearing House (ACH) disputes. Extend the prebuilt guided dispute intake form to capture ACH disputes alongside card transactions. The intake form includes specific questions tailored for ACH cases to reduce data entry errors.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Agentforce Financial Services, formerly Financial Services Cloud.

Who: To use this feature, users need the OmniStudio Admin, OmniStudio User, and Financial Services Cloud Extension or FSC Service permission sets.

Increase Dispute Intake Flexibility for Service Representatives

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. How: In Setup, find and select **Stage Definitions**. Click **New** and select **Use a Template**, and then select **Mastercom Fulfillment Definition**.

Use More Agentforce Financial Services Objects with Data Cloud

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Unify client data across channels by ingesting Lead, Case, and Financial Account Transaction objects from Financial Services Cloud into Data Cloud.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions where Financial Services Cloud is enabled.

New Agentforce Financial Services Jumpstart Bundles

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly get started with Agentforce Financial Services, formerly Financial Services Cloud, by using preconfigured features and flows designed to reduce setup time and complexity.

Get started with household relationship management and financial visibility, including preconfigured features and flows

Use the new **Household Jumpstart** bundle in Salesforce Go.

New and Changed Agentforce Financial Services Objects

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with new and updated Agentforce Financial Services, formerly Financial Services Cloud, objects.

Flexible Hierarchies

Represent the structure and hierarchy of relationships among individuals or entities within an organization or between organizations.

Use the new **Flexible Hierarchy** object.

Represent a unique entity within the hierarchy, such as a company, a subsidiary, a branch unit, or an individual person.

Use the new **Flexible Hierarchy Node** object.

Represent the type of relationship between any two nodes in an hierarchy.

Use the new **Flexible Hierarchy Node Relation** object.

Advanced Document Validation

Define configurations that group fields for specific business purposes.

Use the new **Onboarding Data Object Group** object.

Track different versions of an onboarding data object group.

Use the new **Onboarding Data Object Group Version** object.

Represent individual object within an onboarding data object group.

Use the new **Onboarding Data Object** object.

Represent a field in an onboarding data object group.

Use the new **Onboarding Data Object Field** object.

New Connect REST API for Flexible Hierarchies

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Ensure your flexible hierarchies are in Draft status and meet data model constraints before processing.

Validate multiple flexible hierarchies asynchronously.

Make a POST request to the `/connect/flexible-hierarchies/actions/bulk-validate` resource.

New request body: Flexible Hierarchy Bulk Validation Input

New response body: Flexible Hierarchy Bulk Validation Details

Health

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Discover, set up, and track usage of Agentforce Health, formerly Health Cloud, with Salesforce Go. Summarize claim and member coverage details by using Agentforce for Payer Contact Center. Improve data extraction accuracy by using custom extraction templates. Secure data continuity through offline assessments by using Home Health. Leverage Integrated Care Management to support suggested

responses and autosave for all assessments. Resolve duplicate prior authorization request cases by using Utilization Management.

Health Cloud is now Agentforce Health. You may see references to Health Cloud in our application and documentation.

Simplify Health Cloud Feature Discovery and Setup

With Salesforce Go, discover and set up Health Cloud features, and track feature usage, all from a single location in Setup. Learn more about features and get help with configuration by accessing content resources and links.

Agentforce for Health Cloud

Find and summarize claim and member coverage details quickly by using Agentforce for Payer Contact Center. Increase efficiency by updating athenahealth patient records directly from Health Cloud.

Data Cloud for Health Cloud

Easily integrate Data Cloud with Health Cloud by using the new HealthCloud Provider and Utilization Management data kits.

Disease Surveillance Enhancements

Gain a complete view of disease trends, identify outbreak warnings, and monitor critical metrics using the integrated data analytics and visualization dashboards within the Disease Surveillance app.

Home Health Enhancements

Promote scheduling flexibility and resource optimization by managing patient care across multiple addresses. Customize visits with unique instructions to promote precise execution and accurate delivery of care. Capture assessment data offline to maintain workflow efficiency and secure critical data integrity in any setting. Improve financial reliability and compliance by calculating home visit budgets based on benefit frequency.

Integrated Care Management Enhancements

Give care managers data-driven suggested responses for Discovery Framework-based internal assessments and Milliman Care Guidelines (MCG) assessments. Boost community engagement and improve assessment completion rates by exposing MCG assessments on Experience Cloud sites. Prevent duplicate care plan elements by using the enhanced workflow for updating care plans. Get clean and accurate assessment data with autosave for internal assessments and MCG assessments.

Utilization Management Enhancements

Quickly identify and resolve duplicate prior authorization request cases to ensure clean and accurate data. Accelerate the approval of non-duplicate prior authorization requests by using the new deduplication flow.

Health Cloud Voice of the Customer Enhancements

You asked, we listened. Maximize your success by using these enhancements inspired by your feedback.

New and Changed Objects in Health Cloud

Store and access more data with these new and changed Health Cloud objects.

New and Enhanced Common Features for Agentforce Health

Agentforce Health, formerly Health Cloud, includes access to some features that are available across clouds and products in Industries. Use these features to extend and customize Agentforce Health based on your business needs.

- [Action Launcher](#)
Extend action recommendations by using contextual information from service records to determine user intent.
- [Action Plans](#)
Customize the quick actions on an action plan template record page. Include document checklist items in actions plans for financial accounts. Learn about the life events in a client's household at a glance.
- [Actionable Relationship Center](#)
View many-to-one relationship type records on an Actionable Relationship Center (ARC) graph.
- [Batch Management](#)
Use related object fields to control eligibility criteria and to group records for processing. Make the most of the new enhancements to fast-track batch job runs.
- [Business Rules Engine](#)
Experience improved scalability in decision tables with increased limits for invocations, output results, columns, and row processing. Expression sets enhancements include support for the IF function, automatic element naming, proactive alerts for constraint violations, and improved Salesforce Flow integration.
- [Criteria-Based Search and Filter](#)
Use Criteria-Based Search and Filter to design a search experience for your users. You can configure a search based on a single object that unifies complex sets of data, such as inventory and aggregated customer information that's otherwise spread across multiple objects and fields. Criteria-Based Search and Filter can be customized to meet varied business requirements.
- [Data Processing Engine](#)
Preview how your definitions transform data and instantly validate and debug definition design right for the builder. Create and run definitions in Data 360 companion orgs. Use a unified view to track the performance and key metrics of definitions. Get actionable recommendations for failed runs and download failed records to debug faster. Find and focus the Data Processing Engine canvas on nodes that you want to work on.
- [Discovery Framework](#)
Easily present forms in the user's preferred language by storing assessment questions and responses in multiple languages. Save time by creating assessment questions with Generative AI so that you can generate, edit, and refine questions by using natural language instructions.
- [Omnistudio](#)
Use Omnistudio features to extend and customize your product based on your business needs.

Simplify Health Cloud Feature Discovery and Setup

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Salesforce Go, discover and set up Health Cloud features, and track feature usage, all from a single location in Setup. Learn more about features and get help with configuration by accessing content resources and links.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions with Health Cloud.

Agentforce for Health Cloud

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Find and summarize claim and member coverage details quickly by using Agentforce for Payer Contact Center. Increase efficiency by updating athenahealth patient records directly from Health Cloud.

[Access Member Plans and Eligibility Data by Using Agent Actions](#)

Help your payer contact center reps quickly address member and provider questions about coverage, eligibility, and cost shares. New member coverage actions use structured data from Data 360 to summarize and query coverage details, so your reps can accurately address common member concerns about plan details and covered services.

[Document AI for Health \(formerly Intelligent Document Processing\) Enhancements](#)

Intelligent Document Processing is now Document AI for Health. Improve data quality and extraction accuracy for healthcare documents by using custom extraction templates and confidence scores to identify data that needs manual review. Validate extraction output in real time through a playground before saving it.

[Add Agentforce to Payer Contact Center Quickly](#)

Set up Agentforce for your payer contact center by using a guided setup, and make sure that your contact center reps are productive from day one. Create a data graph, review flows, and configure agent topics and actions by following the easy-to-understand steps. Stay focused and on task by using the direct links to the in-app setup pages and comprehensive help articles.

[Manage Patient Updates Faster with Agentforce for Provider Contact Center](#)

Streamline case handling, reduce repeat calls, and ensure accurate patient data by managing key updates directly within Agentforce. Help your contact center reps quickly add caregiver details, update patient information such as demographics and caregiver information, and send medication refill requests, all in one place. Strengthen service quality by ensuring reps always have current patient information, enabling faster and more efficient patient interaction, smoother hand off across teams, and stronger first-call resolution.

Resolve Claims Queries Faster by Using Data 360 Zero-Copy Claims Actions

Give your payer contact center reps the tools to resolve member and provider claims queries more efficiently by using adjudicated claims data. By using Data 360 claims actions, agents can now fetch adjudicated claim records directly from external systems via zero-copy integration. Agents can use the adjudicated claim records to provide payer contact center reps quick access to high-level summaries and specific claim details, such as status, denial reasons, and patient responsibility.

Update athenahealth Patient Records Directly from Health Cloud

Connect Health Cloud and the athenahealth Electronic Health Records (EHR) to support real-time data write-back for patient records. Eliminate context switching and duplicate data entry, and give your care team immediate access to the most current patient data. Improve the efficiency and the overall quality of care by helping your care team capture and share the most up-to-date patient information from your Health Cloud org.

Access Member Plans and Eligibility Data by Using Agent Actions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help your payer contact center reps quickly address member and provider questions about coverage, eligibility, and cost shares. New member coverage actions use structured data from Data 360 to summarize and query coverage details, so your reps can accurately address common member concerns about plan details and covered services.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions with the Health Cloud, Agentforce for Health Cloud, and Data Cloud add-on licenses. To access the agent action, users also need the Agentforce for Health Cloud add-on.

When: This feature is available starting Feb 13, 2026.

Who: This feature is available to users with the Contact Center for Health Cloud permission set, the Contact Center Agent for Health Cloud permission set, and the Use Contact Center AI Assistive Agent user permission.

How: On the Contact Center Settings page in Setup, turn on Contact Center for Health Cloud. Then, follow the guided setup in the Agentforce for Payer Contact Center section.

Document AI for Health (formerly Intelligent Document Processing) Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Intelligent Document Processing is now Document AI for Health. Improve data quality and extraction accuracy for healthcare documents by using custom extraction templates and confidence scores to identify data that needs manual review. Validate extraction output in real time through a playground before saving it.

Intelligent Document Processing Is Now Document AI for Health

The Intelligent Document Processing feature is now called Document AI. All existing document extraction capabilities remain unchanged.

Support Diverse Healthcare Document Types with Custom Document Extraction Templates

Help your public health investigators and case intake specialists process a wider range of documents, including PDF, JPG, and PNG files, by using custom extraction templates for specific healthcare scenarios. Improve operational efficiency, reduce manual data entry, and get faster access to accurate, structured data that maps correctly to your Health Cloud data model.

Review the Accuracy of Extracted Data with Confidence Scores

Improve extraction accuracy and save review time with a confidence score next to each extracted field. Help your public health investigators and case intake specialists identify values that fall within a defined low-confidence range and require an additional manual review. Strengthen validation, minimize errors, and maintain high-quality health records by concentrating efforts only on fields that require attention.

Preview and Validate Extraction in Real Time

Ensure faster and accurate template creation by using a real-time playground to validate extraction behavior and experiment with prompt variations during template setup. Preview extracted results instantly by uploading a sample file to confirm the accuracy of the results before saving them. Identify missing or incorrect fields early in the process to reduce trial and error. Improve data quality and deliver cleaner, structured outputs that align with the Health Cloud data model.

Intelligent Document Processing Is Now Document AI for Health

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Intelligent Document Processing feature is now called Document AI. All existing document extraction capabilities remain unchanged.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions of Health Cloud with the Agentforce for Health Cloud add-on license.

Support Diverse Healthcare Document Types with Custom Document Extraction Templates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help your public health investigators and case intake specialists process a wider range of documents, including PDF, JPG, and PNG files, by using custom extraction templates for specific healthcare scenarios. Improve operational efficiency, reduce manual data entry, and get faster access to accurate, structured data that maps correctly to your Health Cloud data model.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions of Health Cloud with the Agentforce for Health Cloud add-on license.

Why: Custom extraction template offers extensive controls over context definition, prompt description, LLM selection, and object and field level configuration. These controls help you improve the extraction accuracy and reduce the chances of missing important data.

Who: This feature is available to users with the Health Cloud Foundation, Data Cloud User, Disease Surveillance, and Document AI permission sets.

How: To create a custom extraction template, in Setup, go to the Document AI for Health page. Click **Create Extraction Template**.

Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get comprehensive data analytics and visualization capabilities by using the dashboards in the Disease Surveillance Analytics app. You can visualize key disease case trends, identify potential warnings that cause outbreaks, and monitor critical metrics such as hospitalizations and mortality. Use the dashboards to analyze case trends and use Agentforce actions to conduct deeper investigations and understand disease spread.

Where: This change applies to Lightning Experience in Enterprise, Developer, and Unlimited editions of Health Cloud.

Who: The dashboards are part of the Disease Surveillance app, which is available to users with the Health Cloud Foundation and Disease Surveillance permission sets. To access the dashboards, users also need the Data Cloud Admin and Epidemiological Insights for Disease Surveillance user permission, and the Tableau Next Limited Consumer license and permission set.

Home Health Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Promote scheduling flexibility and resource optimization by managing patient care across multiple addresses. Customize visits with unique instructions to promote precise execution and accurate delivery of care. Capture assessment data offline to maintain workflow efficiency and secure critical data integrity in any setting. Improve financial reliability and compliance by calculating home visit budgets based on benefit frequency.

Simplify Coordination of Home Healthcare Across Patient Locations

Address complex scheduling needs, optimize resource allocation, and ensure uninterrupted patient care by associating multiple home visit locations with a single patient. Give patients greater control by allowing them to select from various addresses, such as billing, shipping, or any saved address for temporary or seasonal homes. If the preferred address isn't linked to the patient, schedulers can easily add it during the scheduling process. This flexibility helps to save the time and effort involved in navigating through multiple pages.

Personalize Home Healthcare by Using Custom Visit Instructions

Equip your care resources with precise, relevant instructions needed for efficient and accurate execution of every patient home visit. Schedulers can use work plan templates and work plan steps to add instructions when they schedule visits. Beyond selecting standard work plan templates, schedulers can also create custom templates to assign patient-specific instructions. For dependent visits, schedulers can add contextual instructions tailored for each involved care resource.

Enhance Health Outcomes with Offline Home Healthcare Assessments

Drive the effective execution of home healthcare visits by capturing patient assessment responses, even in low- or no-connectivity environments. Clinicians can save time and maintain workflow efficiency by using the Salesforce Field Service mobile app to complete assessments offline. Provide uninterrupted care services and capture critical data, regardless of where the care is delivered.

Calculate Budgets Precisely with Benefit Frequency

Boost compliance, minimize budgeting errors, and streamline patient approvals with the advanced budget management capabilities of Home Health. Incorporate the period frequency of care benefits along with the total price directly into the healthcare budget calculations. Improve overall financial reliability and operational confidence by accurately pro-rating benefit amounts based on their defined frequency.

Expedite Your Home Health Setup

Set up offline home healthcare assessments and configure object permissions for agent actions by using the new steps in the Home Health guided setup. Reduce implementation time by following the simple, clear steps for tasks such as prerequisite checks and process setups, all from one place. Stay focused by using the links to the in-app setup pages and detailed help articles.

Integrated Care Management Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give care managers data-driven suggested responses for Discovery Framework-based internal assessments and Milliman Care Guidelines (MCG) assessments. Boost community engagement and improve assessment completion rates by exposing MCG assessments on Experience Cloud sites. Prevent duplicate care plan elements by using the enhanced workflow for updating care plans. Get clean and accurate assessment data with autosave for internal assessments and MCG assessments.

Optimize Smart Patient Care with Suggested Assessment Responses

Help care managers administer assessments faster by enabling suggested responses for Discovery Framework-based internal assessments and Milliman Care Guidelines (MCG) assessments. Reduce manual data entry by getting suggested responses for assessment questions based on sources such as previous responses and Einstein Generative AI. Care managers can review, accept, or dismiss the suggestions to ensure human oversight, improve efficiency, and deliver an improved patient experience.

Boost Patient Engagement with MCG Assessments for Experience Cloud Sites

Deliver a more engaging and improved patient experience by exposing MCG assessments to Experience Cloud sites. Care managers can securely send MCG assessments to community members via email so that members can complete the assessments on the Experience Cloud site in their own time, without having to visit a clinic or hospital. Improve assessment completion rates by making assessments more accessible and flexible.

Prevent Data Loss by Automatically Saving Assessments

Help care managers administer assessments without worrying about data loss with autosave for Discovery Framework-based internal assessments and MCG assessments. As care managers enter assessment responses, the assessment is automatically saved every few seconds. They can also leave the assessment and later resume exactly where they left off, as the assessment is saved with an In Progress status.

Streamline Care Plan Updates with the Enhanced Workflow

Get a clean and structured care plan and reduce administrative overhead when you update care plan elements. Care managers can add new problems, goals, and interventions to a care plan's existing hierarchy without duplicating the care plan elements.

Improve Data Security with the Enhanced Member Plans Data Model

Improve data security and enhance alignment with payer workflows by using the new Member Plan Care Plan, Member Plan Medication Statement, and Purchaser Plan Care Program objects. These junction objects ensure that care teams only access care data tied to the specific member plans and purchaser plans that they're authorized for.

Optimize Smart Patient Care with Suggested Assessment Responses

This release is in preview

These junction objects ensure that care teams only access care data tied to the specific member plans and purchaser plans that they're authorized for.

Where: This change applies to Lightning Experience in Enterprise and Unlimited editions with Health Cloud.

Who: This feature is available to users with the Health Cloud and Health Cloud Platform permission set licenses, and the Health Cloud Foundation permission set.

Utilization Management Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly identify and resolve duplicate prior authorization request cases to ensure clean and accurate data. Accelerate the approval of non-duplicate prior authorization requests by using the new deduplication flow.

Safeguard Data Integrity By Resolving Duplicate Prior Authorization Request Cases

Improve payer workflow and ensure clean and accurate prior authorization request data. Close duplicate prior authorization request cases by using the new Identify and Resolve Duplicate Prior Authorization Request Cases flow. Detect potential duplicate case records and present the records to users for quick comparison and resolution.

Instantly Approve Non-Duplicate Prior Authorization Requests

Reduce manual review time for payers and accelerate prior authorization approvals by using the Automatically Approve Prior Authorization Requests flow. The flow uses an expression set to instantly approve eligible non-duplicate prior authorization requests, updates the claim status to Approved, and closes the associated case. Ensure faster service and improve satisfaction for members and providers by reducing administrative burdens.

Safeguard Data Integrity By Resolving Duplicate Prior Authorization Request Cases

This release is in preview

How: From Setup, go to Flows and find the Automatically Approve Prior Authorization Requests flow. Clone and configure the flow as required and activate it.

Health Cloud Voice of the Customer Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You asked, we listened. Maximize your success by using these enhancements inspired by your feedback.

Behavioral Health

Care Facility Bed is now available as a related list for Healthcare Facility records.

Clinical and Referral Management

You can now select Clinical Service Request History or Clinical Service Requests with Activities as custom report types.

Provider Network Management

To support reporting on rate structures assigned to provider contracts, you can now use these objects in custom reports.

- Contract Payment Agreement as a child of Contract
- Capitation Care Fee Agreement as a child of Contract Payment Agreement
- Bundled Care Fee Agreement as a child of Contract Payment Agreement
- Categorized Care Fee Agreement as a child of Contract Payment Agreement
- Shared Saving Payment Agreement as a child of Contract Payment Agreement
- Preventive Care Agreement as a child of Contract Payment Agreement
- Standard Care Fee Agreement as a child of Contract Payment Agreement
- Percentile Based Care Fee Agreement as a child of Contract Payment Agreement
- Fee Schedule Definition as a child of Contract Payment Agreement
- Care Fee Schedule Item as a child of Fee Schedule Definition

Provider Relationship Management

To show the Care Specialty to Taxonomy relationship on the Provider page layout, we added a standard lookup relationship between Care Specialty and Taxonomy.

Care Specialty Taxonomy is now available as a child of Care Specialty and Care Taxonomy for custom report types.

New and Changed Objects in Health Cloud

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Store and access more data with these new and changed Health Cloud objects.

Disease Surveillance

Represent a predefined framework or configuration for automating document data extraction. It contains essential meta data such as the definition's name, description, and status. It supports versioning, which allows different configurations to be created and used for various document extraction needs.

Use the new **DocumentExtractionDef** object.

Represent a specific version of a document extraction definition configured for a particular use case. It includes detailed information such as the description, version number, status, and other relevant parameters for data extraction. Each version captures a unique setup, allowing users to manage and adapt document extraction to their needs.

Use the new **DocumentExtractionDefVer** object.

Home Health

Specify the frequency type of the coverage benefit associated with the home healthcare visit

Use the new **FrequencyType** field on the CoverageBenefit object.

Specify the total amount of the coverage benefit associated with the home healthcare visit

Use the new **TotalBenefitAmount** field on the CoverageBenefit object.

Specify the frequency type of the coverage benefit item associated with the home healthcare visit

Use the new **FrequencyType** field on the CoverageBenefitItem object.

Specify the frequency type of the plan benefit associated with the home healthcare visit

Use the new **FrequencyType** field on the PlanBenefit object.

Specify the total amount of the plan benefit associated with the home healthcare visit

Use the new **TotalBenefitAmount** field on the PlanBenefit object.

Specify the frequency type of the plan benefit item associated with the home healthcare visit

Use the new **FrequencyType** field on the PlanBenefitItem object.

Insurance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Digital Insurance capabilities in your existing org along with the Insurance managed package or Insurance CRM. Optimize policy issuance, renewals, endorsements, and cancellations with complete versioning. Manage the end-to-end agency billing workflow with greater accuracy, automation, and financial control. Boost sales efficiency with unified multi-root quoting. Help users compare insurance

products side by side and select an optimal plan. Apply policy limits over more flexible durations, automatically cap payments at the lowest remaining limit, and authorize and track ex-gratia payments.

Use Digital Insurance Alongside the Insurance Managed Package or Insurance CRM

Launch new products faster on the flexible Digital Insurance platform while you manage existing products, policies, and claims in the same org. Eliminate the overhead of administering separate orgs or rebuilding custom integrations extensively. Manage products, quotes, policies, and claims using solution-specific workflows and keep the transactional data, metadata, and automations segregated based on the originating solution. Although Digital Insurance can coexist with Insurance CRM or the Insurance managed package, these solutions don't interoperate.

Accelerate Sales with Unified Multi-Root Insurance Quoting

Create a single, comprehensive quote that includes multiple root products, such as Auto and Home. Captive agents can configure and price several products together and present them as a single offering. All lifecycle operations are managed at the parent policy level, and premiums and taxes aggregate from each child policy to deliver a consolidated financial overview. Use the multi-root issuance API (or invocable action) to create the parent and child policies upon quote acceptance. Manage subsequent renewals and endorsements at the parent policy level using the corresponding multi-root APIs or invocable actions.

Manage Policy Lifecycle Better with Enhanced Versioning

Optimize policy issuance, renewals, endorsements, and cancellations with complete versioning. Simplify the tracking of policy changes and mid-term adjustments during endorsements, helping service teams stay aligned with carrier updates.

Agency Billing

Manage the end-to-end agency billing workflow with greater accuracy, automation, and financial control across invoicing, payments, journals, and collections.

Enable Comparative Rating and Multiple Plan Selection

The Product Selection Lightning Web Component for Omnistudio allows end users to effortlessly compare multiple rated insurance products and choose the optimal plan directly within a guided Omniscript flow. Quickly compare up to three different root products side-by-side to understand variations in coverages and pricing. This component passes multiple rating inputs to the Insurance Rating API, which rates several root products and returns the calculated premiums and details. The UI displays product cards showing the premium and taxes for each option.

Validate Complex Configurations with Constraint Rules Engine

With Constraint Rules Engine (CRE), use constraint-based logic to validate complex product configurations. This feature supports deeply nested bundles, cross-product dependencies, and multi-instance insurance scenarios. CRE ensures accurate quoting by preventing invalid selections while you transition from Business Rules Engine to a constraint-driven model. For Insurance, Constraint Rules Engine is currently only supported for exclusions, clauses and configuration rules.

Simplify Quoting and Policy Configuration through Guided Flows

With the Product Configuration Lightning Web Component, users can immediately see how policy attribute changes affect the premium, enabling efficient, real-time quote generation. This component for Omnistudio accepts multiple rating inputs and calls the Insurance Rating POST and PATCH APIs to update attribute values for specific coverages.

Track Policy Limits with Flexible Duration Types

Reset policy limits at the end of a calendar year or on a specific override date, or enforce lifetime limits that don't reset. Previously, you could only reset limits at the end of a policy term.

Cap Payments at the Lowest Limit for Loss Claims

Adjusters can now determine the correct payable amount without manual calculations before they request approvals. Enforce the lowest remaining limit, and track consumption across sub-coverage, coverage, and policy levels for loss-type payments. Prevent failed payments, recalculations, and messy audit trails.

Revise Claim Coverage Payment Details to Make Corrections

Edit details such as the payee or the claim amount for a claim coverage payment. Calculate the new adjusted amount and update the limit tracking for accurate audit trails. Previously, you deleted a claim coverage payment detail record and created a new one to update details.

Issue Ex Gratia Payments for Loss Claims

Authorize exceptional payments for loss claims that exceed the policy or coverage limits. Track ex gratia payments for auditability while capping consumption at the remaining limit. Handle special circumstances and maintain positive customer relations without manual workarounds or negative balances.

Copy Data Between Nodes in a Pricing Procedure

Gather the required data for price calculations by copying attributes to a node from its parent, child, or other related nodes. Previously, you could only aggregate numerical attributes from related nodes as a workaround but couldn't access the text attributes. For example, when calculating the premium for collision coverage, add attributes from the product, vehicle, and driver nodes to the coverage node to compile the data for the calculation.

New and Changed Objects in Insurance

Do more with the new and updated Insurance objects.

Use Digital Insurance Alongside the Insurance Managed Package or Insurance CRM

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Agency Billing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage the end-to-end agency billing workflow with greater accuracy, automation, and financial control across invoicing, payments, journals, and collections.

Automate Agency Billing Journals

Strengthen financial accuracy and control by defining accounting periods for each legal entity by maintaining a chart of accounts. Then, automatically generate dual-entry journal entries based on billing transaction types and general ledger assignment rules.

Streamline Cash Flow with Automated Payment Processing

Automate the collection of payments for policy invoices and processing of refunds for policy changes or cancellations. Settle open balances promptly and maintain accurate financial reporting by applying payments directly to policy invoices.

Stay on Top of Overdue Premiums with Collections

Manage overdue invoices and reduce the risk of unpaid premiums with Collections. Easily see outstanding policy invoices, follow up on missed payments, and record payment commitments from policyholders. Automated reminder emails help recover overdue amounts more efficiently and support steady cash flow.

Schedule and Generate Invoices for Insurance Policies

Easily configure billing preferences for insurance policies, including tax and proration policies, in a purpose-built object. Set up invoice schedulers to generate invoices at regular intervals or generate on-demand invoices.

Generate Policy Transactions and Breakdowns

Automatically generate policy transactions and detailed breakdowns to reflect the financial impact of policy events. The transaction breakdown provides a clear view of insurance premium, commissions, taxes, and fees drawn from coverages, insured items, and insured parties.

Effortlessly Configure Billing Settings for Insurance Policies

Simplify the management of insurance policy transactions by using the Billing Setup panel to quickly enable transaction and transaction-detail generation for policy lifecycle events. You can also configure and customise the context mappings that are used to create billing schedules.

Automate Agency Billing Journals

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Strengthen financial accuracy and control by defining accounting periods for each legal entity by maintaining a chart of accounts. Then, automatically generate dual-entry journal entries based on billing transaction types and general ledger assignment rules.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions of Insurance Brokerage User Addon with InsuranceBrokerageAddon, InsBrokerageFoundationAddon, InBrokerageCmsnMgmtAddon, InBrokeragePolicyManagementAddon, InsBillingIntegrationAddon, InsuranceBrokerageCreditsAddon-1, InsBrokerageCmsnMgmtCreditsAddon, InsBrokeragePlcyLifecyclMgmtCreditsAddon-1, and InsBillingIntegrationCreditsAddon-1 licenses.

How: From Setup, in the Quick Find box, find and select **Billing Settings**, and turn on **Create Transaction Journals for Transactions**. Then, create general ledger accounts and assignment rules, and define the criteria for billing transactions.

Streamline Cash Flow with Automated Payment Processing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Automate the collection of payments for policy invoices and processing of refunds for policy changes or cancellations. Settle open balances promptly and maintain accurate financial reporting by applying payments directly to policy invoices.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions of Insurance Brokerage User Addon with InsuranceBrokerageAddon, InsBrokerageFoundationAddon, InBrokerageCmsnMgmtAddon, InBrokeragePolicyManagementAddon, InsBillingIntegrationAddon, InsuranceBrokerageCreditsAddon-1, InsBrokerageCmsnMgmtCreditsAddon, InsBrokeragePlcyLifecyclMgmtCreditsAddon-1, and InsBillingIntegrationCreditsAddon-1 licenses.

How: From the App Launcher, open **Billing Batch Schedulers**, and create a Payment Scheduler. Give it a name, choose when and how often to run payments, set any needed matching criteria, and activate the scheduler.

Stay on Top of Overdue Premiums with Collections

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage overdue invoices and reduce the risk of unpaid premiums with Collections. Easily see outstanding policy invoices, follow up on missed payments, and record payment commitments from policyholders. Automated reminder emails help recover overdue amounts more efficiently and support steady cash flow.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions where Financial Service Cloud and Insurance Brokerage are enabled.

How: From the App Launcher, open **Collection Plans** and create a new plan. Select the account and contact, choose a reason, set the usage type, and add any optional details. Save the plan to begin tracking overdue balances and follow-up activity.

Schedule and Generate Invoices for Insurance Policies

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Easily configure billing preferences for insurance policies, including tax and proration policies, in a purpose-built object. Set up invoice schedulers to generate invoices at regular intervals or generate on-demand invoices.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions of Insurance Brokerage User Addon with InsuranceBrokerageAddon, InsBrokerageFoundationAddon, InBrokerageCmsnMgmtAddon, InBrokeragePolicyManagementAddon, InsBillingIntegrationAddon, InsuranceBrokerageCreditsAddon-1, InsBrokerageCmsnMgmtCreditsAddon, InsBrokeragePlcyLifecyclMgmtCreditsAddon-1, and InsBillingIntegrationCreditsAddon-1 licenses.

How: From the Insurance Policy record page, click **New** on the Insurance Policy Billing Information related list. Enter the required billing information and save your changes. Then, generate invoices automatically based on billing schedules or generate on-demand invoices.

Generate Policy Transactions and Breakdowns

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Automatically generate policy transactions and detailed breakdowns to reflect the financial impact of policy events. The transaction breakdown provides a clear view of insurance premium, commissions, taxes, and fees drawn from coverages, insured items, and insured parties.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions of Insurance Brokerage User Addon with InsuranceBrokerageAddOn, InsBrokerageFoundationAddOn, InBrokerageCmsnMgmtAddOn, InBrokeragePolicyManagementAddOn, InsBillingIntegrationAddOn, InsuranceBrokerageCreditsAddOn-1, InsBrokerageCmsnMgmtCreditsAddOn, InsBrokeragePlcyLifecyclMgmtCreditsAddOn-1, and InsBillingIntegrationCreditsAddOn-1 licenses.

How: From the original insurance policy record page, click **Issue**, **Renew**, **Endorse**, or **Cancel** to generate the related transaction and transaction details.

Effortlessly Configure Billing Settings for Insurance Policies

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Simplify the management of insurance policy transactions by using the Billing Setup panel to quickly enable transaction and transaction-detail generation for policy lifecycle events. You can also configure and customise the context mappings that are used to create billing schedules.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions where Financial Service Cloud and Insurance Brokerage are enabled.

How: From Setup, in the Quick Find box, find and select **Policy Lifecycle**, and update the Generate Insurance Policy Transactions and Generate Insurance Policy Transaction Details settings. Then, in the Quick Find box, search for **Billing Context Settings**, and configure the context mappings used to create billing schedules.

Enable Comparative Rating and Multiple Plan Selection

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Product Selection Lightning Web Component for Omnistudio allows end users to effortlessly compare multiple rated insurance products and choose the optimal plan directly within a guided Omniscript flow. Quickly compare up to three different root products side-by-side to understand variations in coverages and pricing. This component passes multiple rating inputs to the Insurance Rating API, which rates several root products and returns the calculated premiums and details. The UI displays product cards showing the premium and taxes for each option.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Digital Insurance.

Validate Complex Configurations with Constraint Rules Engine

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Constraint Rules Engine (CRE), use constraint-based logic to validate complex product configurations. This feature supports deeply nested bundles, cross-product dependencies, and multi-instance insurance scenarios. CRE ensures accurate quoting by preventing invalid selections while you transition from Business Rules Engine to a constraint-driven model. For Insurance, Constraint Rules Engine is currently only supported for exclusions, clauses and configuration rules.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Digital Insurance.

[Salesforce Help: Constraint Rules Engine Adoption for Insurance \(can be outdated or unavailable during release preview\)](#)

Simplify Quoting and Policy Configuration through Guided Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With the Product Configuration Lightning Web Component, users can immediately see how policy attribute changes affect the premium, enabling efficient, real-time quote generation. This component for Omnistudio accepts multiple rating inputs and calls the Insurance Rating POST and PATCH APIs to update attribute values for specific coverages.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Digital Insurance.

See Also

[Salesforce Help: Insurance Product Configuration Lightning Web Component \(can be outdated or unavailable during release preview\)](#)

Track Policy Limits with Flexible Duration Types

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reset policy limits at the end of a calendar year or on a specific override date, or enforce lifetime limits that don't reset. Previously, you could only reset limits at the end of a policy term.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with the DigitalInsuranceClaimManagementAddOn, DigitalInsuranceClaimManagementPCAddOn, DigitalInsuranceClaimManagementCCAddOn, DigitalInsuranceProductAdministrationAddOn, DigitalInsurancePolicyAdministrationAddOn, DigitalInsuranceProductRuntimeCCAddOn, and DigitalInsuranceProductRuntimePCAddOn licenses.

Cap Payments at the Lowest Limit for Loss Claims

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Adjusters can now determine the correct payable amount without manual calculations before they request approvals. Enforce the lowest remaining limit, and track consumption across sub-coverage, coverage, and policy levels for loss-type payments. Prevent failed payments, recalculations, and messy audit trails.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with the DigitalInsuranceClaimManagementAddOn, DigitalInsuranceClaimManagementPCAddOn, DigitalInsuranceClaimManagementCCAddOn, DigitalInsuranceProductAdministrationAddOn, DigitalInsurancePolicyAdministrationAddOn, DigitalInsuranceProductRuntimeCCAddOn, and DigitalInsuranceProductRuntimePCAddOn licenses.

Revise Claim Coverage Payment Details to Make Corrections

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Edit details such as the payee or the claim amount for a claim coverage payment. Calculate the new adjusted amount and update the limit tracking for accurate audit trails. Previously, you deleted a claim coverage payment detail record and created a new one to update details.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with the DigitalInsuranceClaimManagementAddOn, DigitalInsuranceClaimManagementPCAddOn, DigitalInsuranceClaimManagementCCAddOn, DigitalInsuranceProductAdministrationAddOn, DigitalInsurancePolicyAdministrationAddOn, DigitalInsuranceProductRuntimeCCAddOn, and DigitalInsuranceProductRuntimePCAddOn licenses.

Issue Ex Gratia Payments for Loss Claims

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Authorize exceptional payments for loss claims that exceed the policy or coverage limits. Track ex gratia payments for auditability while capping consumption at the remaining limit. Handle special circumstances and maintain positive customer relations without manual workarounds or negative balances.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with the DigitalInsuranceClaimManagementAddOn, DigitalInsuranceClaimManagementPCAddOn, DigitalInsuranceClaimManagementCCAddOn, DigitalInsuranceProductAdministrationAddOn, DigitalInsurancePolicyAdministrationAddOn, DigitalInsuranceProductRuntimeCCAddOn, and DigitalInsuranceProductRuntimePCAddOn licenses.

Copy Data Between Nodes in a Pricing Procedure

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Gather the required data for price calculations by copying attributes to a node from its parent, child, or other related nodes. Previously, you could only aggregate numerical attributes from related nodes as a workaround but couldn't access the text attributes. For example, when calculating the premium for collision coverage, add attributes from the product, vehicle, and driver nodes to the coverage node to compile the data for the calculation.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Digital Insurance where Digital Insurance Product Administration and Salesforce Pricing are enabled.

New and Changed Objects in Insurance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with the new and updated Insurance objects.

Link a policy transaction to a prior transaction

Store the source application context for a quote

Use the new **RecordSource** field on the Quote object.

Life Sciences

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline your Account Management data with Data 360. Focus on the right accounts with the enhanced Next Best Customer component. Make quick, ad hoc adjustments to Activity Plans. Use the enhanced Activity Measure workflow to track a wider range of activities. Boost engagement efficiency with new remote visit capabilities, AI-based and voice-based data capture, and a centralized Visit Management experience in the Service Console. Drive informed execution and mitigate risks effectively with Collaborative Medical Insights. Use Smart Content Search to improve your search results and find

relevant material. Send presentations as unique email links to help healthcare providers save time and find up-to-date content. Access real-time sales data on the Life Sciences Cloud mobile app and plan better customer interactions from anywhere.

Life Sciences Cloud is now Agentforce Life Sciences. You may see references to Life Sciences Cloud in our application and documentation.

Account Management

Streamline Account Management by integrating Data 360 with Life Sciences Cloud using the Life Sciences data kit. Boost user engagement with the enhanced Next Best Customer component. Align out-of-territory accounts to your territory directly on the desktop site.

Engagement Planning

Give your users increased flexibility to adjust their activity plans. Track goal measures for a wider range of activities. Use new trigger handlers to update your activity plan goals and apply adjustment creation limits.

Engagement Execution

Plan and run customer engagements more efficiently with improved remote engagement as well as desktop and new AI features. Expand your remote engagement capabilities by conducting visits through Microsoft Teams and automatically capturing key details. Shape strategies and drive informed execution by capturing field observations and validating them through collaborative insights. Manage visit records from the new Visit List and see which attendees primary account addresses match the visit location in the Attendees sidebar. Also, you can now open presentations and track engagement directly from the desktop Visit Engagement page. Sales reps and service agents can streamline workflows by managing visits within the Salesforce Service Console, alongside related records like accounts, cases, and medical inquiries.

Intelligent Content

Expand your search beyond just presentation names and metadata properties by searching within presentation content. Share presentations with healthcare professionals as unique links instead of as email attachments.

Data and Analytics

Access real-time sales data on the Life Sciences Cloud mobile app, and plan better customer interactions from anywhere.

Mobile App

Increase your efficiency by using deep links to streamline navigation and automate task execution in the Life Sciences Cloud mobile app.

Limited Pilot Features for Life Sciences

Life Sciences Cloud offers the Store Check and Remote Engagement with Microsoft Teams features through limited pilots. Participation in these pilots is optional and at your organization's discretion.

New and Changed Objects for Life Sciences

Do more with the new and changed Life Sciences objects.

Account Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline Account Management by integrating Data 360 with Life Sciences Cloud using the Life Sciences data kit. Boost user engagement with the enhanced Next Best Customer component. Align out-of-territory accounts to your territory directly on the desktop site.

Transform Life Sciences Data with Data 360

Seamlessly integrate Data 360 with Life Sciences Cloud by using the Life Sciences data kit. Streamline your Account Management data by using the preconfigured data stream bundles that harmonize data from various objects. The data kit includes five ready-to-use bundles: Activity Plan, Marketable Product, Presentation, Provider Visit, and Sales Territory Account.

Improve User Engagement with Prioritized Accounts

Help your users focus on the right accounts with the enhanced Next Best Customer component. The updated display offers clearer scoring visibility, intuitive rationales, and richer account insights, powered by the Actionable Relationship Center (ARC) framework. The ARC framework enables a more flexible and informative display of account details, allowing you to make faster and more informed engagement decisions. You can configure the rationale display and related settings directly from the Admin Console.

View and Align Out-of-Territory Accounts on the Desktop Site

Now view and align accounts outside your current territory directly from affiliation lists on the desktop site. Manage your activities more efficiently with immediate access to summaries of affiliated accounts. Previously, this feature was available only on the Life Sciences Cloud mobile app.

Engagement Planning

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your users increased flexibility to adjust their activity plans. Track goal measures for a wider range of activities. Use new trigger handlers to update your activity plan goals and apply adjustment creation limits.

Make Quick, Ad Hoc Adjustments to Your Activity Plans

Gain greater adaptability and flexibility in reaching your targets by submitting activity plan adjustment requests. Track activity types for accounts that aren't in your plan or set goals to track more activity types for your existing accounts. Revise the goal metrics to account for last-minute changes and remove accounts that can no longer be accommodated. Easily modify goals and enforce request creation limits by using new trigger handlers.

Achieve More Personalization with the Updated Activity Measure Workflow

Evaluate goal metrics beyond visit-related activities with the enhanced activity measure workflow. Choose from a wider range of custom and standard objects to monitor your business-specific activities. Also, Activity Type Field and Activity Type Field Value are no longer mandatory for tracking metrics, helping you plan activities quickly without having to provide additional details.

Engagement Execution

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Plan and run customer engagements more efficiently with improved remote engagement as well as desktop and new AI features. Expand your remote engagement capabilities by conducting visits through Microsoft Teams and automatically capturing key details. Shape strategies and drive informed execution by capturing field observations and validating them through collaborative insights. Manage visit records from the new Visit List and see which attendees primary account addresses match the visit location in the Attendees sidebar. Also, you can now open presentations and track engagement directly from the desktop Visit Engagement page. Sales reps and service agents can streamline workflows by managing visits within the Salesforce Service Console, alongside related records like accounts, cases, and medical inquiries.

Shape Strategies by Using Collaborative Medical Insights

Capture observations directly from field interactions in the Life Sciences Cloud mobile app to understand trends and guide engagement strategies. Validate findings through peer upvoting and hierarchical grouping to make sure that high-priority concerns surface quickly. Drive informed execution plans in your team by using insights and shared knowledge to identify opportunities and mitigate risks effectively.

View Attendees with the Same Address Attendees in the Sidebar

Quickly identify attendees linked to the same address by enabling Same-Address Attendees in the Attendee sidebar. When enabled, you can see at a glance which attendees share the same primary account addresses as the visit location.

Manage Visit Records in One Place

Use the new Visit List View, available on the Visit tab, to manage schedules and record keeping. Sort, search, and filter upcoming visit records. You can also add samples and create new visits directly from a list view card.

Start Presentations and Track Engagement from Visits on the Desktop Site

Your field users can now start presentations from the Visit Engagement page and navigate between the presentation player and the visit on the desktop site. Metrics about the slides presented and the linked products and messages are captured on the Visit Engagement page automatically, providing a

more consistent experience. Previously, field users could conduct presentations and track engagement data from visits only in the Life Sciences Cloud mobile app.

Manage Visits from the Service Console

Sales reps and service agents no longer have to switch between windows to manage visits. You can now work with Visits directly in the Salesforce Service Console. Open Visits alongside accounts, cases, and medical inquiries, switch between records without losing context, and use quick actions to navigate between Visit sections and related records, such as Medical Inquiries and Expenses.

Filter Admin Console Tiles Based on User Permissions

Show users only the tiles they need in the Admin Console by turning on Filter Admin Console Tiles Based On User Permissions. Use Life Sciences Customer Engagement Setup to make the change.

Changes to Trigger Handlers

The trigger handlers *VisitConflictValidationHandler* and *DeleteVisitStdEventHandler* are no longer available.

Shape Strategies by Using Collaborative Medical Insights

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Capture observations directly from field interactions in the Life Sciences Cloud mobile app to understand trends and guide engagement strategies. Validate findings through peer upvoting and hierarchical grouping to make sure that high-priority concerns surface quickly. Drive informed execution plans in your team by using insights and shared knowledge to identify opportunities and mitigate risks effectively.

Where: This feature is available in:

- Lightning Experience in Enterprise and Unlimited editions with the Life Sciences Cloud license and the Life Sciences Cloud for Customer Engagement add-on license, and where the Life Sciences Cloud for Customer Engagement managed package is installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

View Attendees with the Same Address Attendees in the Sidebar

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly identify attendees linked to the same address by enabling Same-Address Attendees in the Attendee sidebar. When enabled, you can see at a glance which attendees share the same primary account addresses as the visit location.

Where: This feature is available in:

- Lightning Experience in Enterprise and Unlimited editions with the Life Sciences Cloud license and the Life Sciences Cloud for Customer Engagement add-on license. Also, the Life Sciences Cloud for Customer Engagement managed package must be installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

Manage Visit Records in One Place

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the new Visit List View, available on the Visit tab, to manage schedules and record keeping. Sort, search, and filter upcoming visit records. You can also add samples and create new visits directly from a list view card.

Where: This feature is available in:

- Lightning Experience in Enterprise and Unlimited editions with the Life Sciences Cloud license and the Life Sciences Cloud for Customer Engagement add-on license. Also, the Life Sciences Cloud for Customer Engagement managed package must be installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

Start Presentations and Track Engagement from Visits on the Desktop Site

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Your field users can now start presentations from the Visit Engagement page and navigate between the

presentation player and the visit on the desktop site. Metrics about the slides presented and the linked products and messages are captured on the Visit Engagement page automatically, providing a more consistent experience. Previously, field users could conduct presentations and track engagement data from visits only in the Life Sciences Cloud mobile app.

Where: This feature is available in:

- Lightning Experience in Enterprise and Unlimited editions with the Life Sciences Cloud license and the Life Sciences Cloud for Customer Engagement add-on license, and where the Life Sciences Cloud for Customer Engagement managed package is installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

Manage Visits from the Service Console

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Sales reps and service agents no longer have to switch between windows to manage visits. You can now work with Visits directly in the Salesforce Service Console. Open Visits alongside accounts, cases, and medical inquiries, switch between records without losing context, and use quick actions to navigate between Visit sections and related records, such as Medical Inquiries and Expenses.

Where: This feature is available in:

- Lightning Experience in Enterprise and Unlimited editions with the Life Sciences Cloud license and the Life Sciences Cloud for Customer Engagement add-on license, and where the Life Sciences Cloud for Customer Engagement managed package is installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

Filter Admin Console Tiles Based on User Permissions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Show users only the tiles they need in the Admin Console by turning on Filter Admin Console Tiles Based On User Permissions. Use Life Sciences Customer Engagement Setup to make the change.

Where: This feature is available in:

- Lightning Experience in Enterprise and Unlimited editions with the Life Sciences Cloud license and the Life Sciences Cloud for Customer Engagement add-on license. Also, the Life Sciences Cloud for Customer Engagement managed package must be installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

The trigger handlers *VisitConflictValidationHandler* and *DeleteVisitStdEventHandler* are no longer available.

Intelligent Content

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Expand your search beyond just presentation names and metadata properties by searching within presentation content. Share presentations with healthcare professionals as unique links instead of as email attachments.

Share Presentations as Unique Email Links

Maximize the impact of your content by enabling field users to send presentations as links in preapproved email templates. By using email links, healthcare professionals (HCPs) can view content in a dedicated portal without downloading email attachments. Manage when presentations are available so that HCPs always see the most up-to-date content, and maintain access controls by defining when links expire. Use rich engagement data—including pages viewed, time spent per page, and the HCP's navigation path—to optimize presentations for future engagements.

Use Smart Content Search to Find Relevant Presentations

Improve the quality of your search results by using Data 360 to create a search index of the content in presentation files. While online, field users can search for presentations by using either keywords or conceptual terms and phrases, making it easier to find the most relevant materials. Previously, search results included only standard keyword-based matches on presentation names and metadata properties.

Limited Pilot Features for Life Sciences

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Life Sciences Cloud offers the Store Check and Remote Engagement with Microsoft Teams features through limited pilots. Participation in these pilots is optional and at your organization's discretion.

Where: These features are available in:

- Lightning Experience in Enterprise and Unlimited editions with Data 360, Life Sciences Cloud license, Life Sciences Cloud for Customer Engagement add-on license, and where the Life Sciences Cloud for Customer Engagement managed package is installed.
- Life Sciences Cloud mobile app for iOS (iPad only).

Note Store Check and Remote Engagement with Microsoft Teams are pilot or beta services that are subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer. Use of this pilot or beta service is at the Customer's sole discretion.

Why: These pilot features are available:

- **Store Check (Pilot):** Empower your field teams to move faster with real-time shelf insights, streamlined performance monitoring, and guided in-store execution directly within their workflow. Use Store Check to create products, assortments, high-level task types, and related key performance indicators, each with target values customized to your business needs. Sales reps can then use the Store Check page in the Life Sciences Cloud for Customer Engagement mobile app to efficiently complete their in-store activities.
- **Remote Engagement with Microsoft Teams (Pilot):** Expand your remote engagement capabilities by using Microsoft Teams as a conferencing platform for remote sessions. Life Sciences Cloud for Customer Engagement generates Microsoft Teams meeting links, and healthcare professionals can join remote sessions quickly by using their existing Microsoft Teams accounts on their mobile devices.

During remote sessions, Life Sciences Cloud for Customer Engagement captures details and metrics for the content shared.

How: To learn more or to request access, contact your Salesforce account executive.

New and Changed Objects for Life Sciences

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Do more with the new and changed Life Sciences objects.

Intelligent Content

Share presentations as unique links in email content

Use the new `CanSendPresentationLinks` field on the existing `LifeSciEmailTemplate` object and the new `AccessIdentifier` field on the existing `PresentationPartyAccess` object.

Manufacturing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Discover new capabilities in Manufacturing that enhance efficiency across inventory, appraisals, and sales agreement workflows. From sample management and inventory allocation to data filtering and improved discoverability, these updates help you manage operations with greater accuracy and ease.

Manufacturing Cloud is now Agentforce Manufacturing. You may see references to Manufacturing Cloud in our application and documentation.

[Agentforce for Manufacturing](#)

Scale operations and increase productivity with Agentforce for Manufacturing. New AI-driven capabilities support sales, service estimation, and proactive maintenance. Users can streamline product searches, quote creation, entitlement handling, and pricing calculations, while the agent reduces manual effort and ensures a more accurate outcome.

Manufacturing for Sales

Optimize product sample management and streamline the full lifecycle from request to fulfillment and feedback within a unified ecosystem. Easily manage large sales agreements by viewing up to 20 product lines per page. Use enhanced filters to quickly narrow down associated products, making it faster to track, analyze, and update specific product details.

Manufacturing for Services

Enhance operational efficiency with new capabilities that streamline inventory management. Allocate and count inventory with greater accuracy, manage time sheets, and accelerate recall handling with pre-built templates.

Allocate Inventory Efficiently Across Locations

Manage inventory allocation for sales orders and work orders across multiple locations with accurate, real-time visibility. View stock statuses, such as on-hand, allocated, and available, and soft-reserve inventory for specific orders. Assign inventory to orders to prevent overcommitment, and maintain accurate inventory visibility, even during high-volume, concurrent transactions. This helps prevent stock conflicts, improves tracking accuracy, and supports smarter, more efficient fulfillment decisions.

Enhance Search Experience with Criteria-Based Search and Filter

Criteria-Based Search and Filter (CBSF) now provides a more intuitive and reliable search experience with consistent data display and clear visibility into when data was last updated. Date-time fields appear in the user's timezone using standard Salesforce formatting, and currency fields display symbols instead of codes. Any Word Search is enabled by default in all orgs, and users can view the Last Refreshed Date for search results, enhancing clarity and efficiency.

Extend Stage Management to Additional Manufacturing Objects

Implement stage management across more Manufacturing objects such as Asset, Fleet, Appraisal, Appraisal Item, Product Service Campaign Group Definitions and Product Service Campaign Group Causal Item. Provide a structured, traceable, and controlled process for managing the life-cycle of Manufacturing business operations through defined stages. Maximize service efficiency, reduce turnaround time, and enhance customer lifetime value.

Optimize Channel Operations with Enhanced Channel Revenue Management

Channel Revenue Management now provides enhanced control and efficiency across partner inventory and incentive programs. New features include Stock Rotation Incentives, allowing partners to return or scrap aging stock for rotation credits, while maintaining financial control through precise budget allocation and tracking. Incentive budgets can now be defined, allocated, and monitored across partners and programs. Operational efficiency is improved with integrated workflows for partner submission, eligibility validation, claim creation, and budget tracking.

Access Manufacturing Features and Setup in One Place

Salesforce Go now supports a broader range of Manufacturing features that you can configure and manage from a single location in Setup. Implement features faster, reduce context switching, and simplify setup across your org.

New and Changed Objects for Manufacturing

Manufacturing includes these new and changed objects.

New and Enhanced Common Features for Manufacturing

Manufacturing includes access to some features that are available across clouds and products in Industries. Use these features to extend and customize Manufacturing Cloud based on your business needs.

- [Action Launcher](#)
Make recommendations available in companion orgs to help teams quickly resolve customer issues. Deploy file-based data kits to configure Recommended Actions.
- [Asset Service Lifecycle Management](#)
Quickly find and manage inventory with enhanced batch-level details and search capabilities, improving accuracy and streamlining your inventory processes. Timesheet and labor cost enhancements simplify time tracking, bulk entries, shift differential management, and error correction on mobile devices.
- [Business Rule Engine](#)
Build more granular business-specific configurations by further categorizing Usage Types available in your Salesforce product into Usage Subtypes. Usage Subtype values are available to you depending on your industry solution and permission sets. Asynchronous processes in decision tables now create events when they are completed.
- [Connected Assets](#)
Connect, monitor, and control assets in real time to drive smarter service operations. Define asset structures, collect telemetry data, trigger remote actions, and integrate with Digital Twin to optimize performance, reduce downtime, and enable proactive service delivery.
- [Context Service](#)
Sort and filter data with context filters to retrieve precise and contextually relevant data with dynamic data filters in Context Service. Ensure continuous data flow across applications by modifying mappings without deactivating context definitions. The Time To Live (TTL) value of context instances created by Apex and flows is set to 10 seconds instead of 30 seconds.
- [Data Processing Engine](#)
DPE now offers a debugging feature in beta for CRMA jobs, providing enhanced visibility into failures and outputs to empower users and reduce support reliance. Write back transformed data directly to data model objects (DMOs) using the Data Cloud runtime, with options to create DMOs and validate data types. Writeback nodes are updated to support upserting records with an External ID, improving data sync across different systems. Three new formula functions have been added to give you more control and flexibility in data transformation. The Data Cloud runtime now includes functionality such as composite and custom nodes, the ability to write back to new DLOs, and a debug mode for saving node output record counts.

Agentforce for Manufacturing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Scale operations and increase productivity with Agentforce for Manufacturing. New AI-driven capabilities support sales, service estimation, and proactive maintenance. Users can streamline product searches, quote creation, entitlement handling, and pricing calculations, while the agent reduces manual effort and ensures a more accurate outcome.

Important This feature uses [Einstein Generative AI](#) and may consume Einstein Requests or Flex Credits or Customer Data Cloud Requests. [Einstein Generative AI Features](#) and Data Cloud are provided on a separate infrastructure with different security protections and physical hosting locations than the Services. See [Salesforce Trust and Compliance Documentation](#).

Note Agentforce for Manufacturing is available only in English.

[Accelerate Sales Tasks with Industries Sales Concierge](#)

Empower your sales representatives with AI-driven conversational guidance and actionable insights to work faster and smarter, completing key sales tasks efficiently. Using the Industries Sales Concierge topic, sales reps can search for products and parts with conversational queries, retrieve pricing from the standard price book, and find relevant distributors who sell the chosen products or accessories. The agent helps reps pursue sales conversations with out-of-the-box actions for opportunity and quote creation, initiate trade-in requests for existing assets, generate appraisal records, and draft emails.

[Efficiently Manage Coverages for Proactive Customer Service](#)

Improve proactive customer service by using the enhanced features of the Asset Service Estimation agent topics as part of the Asset Service Management agent. Efficiently select price books for a chosen service work type, the relevant products and their quantities. Choose to specify a different coverage for each product and simplify the process of incorporating asset warranties, entitlements, or service contracts. Create a more enriched quote with the specific discount details for each selected product. Create work orders with an asset's account ID and with the asset name and work type name in the subject.

Accelerate Sales Tasks with Industries Sales Concierge

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Empower your sales representatives with AI-driven conversational guidance and actionable insights to work faster and smarter, completing key sales tasks efficiently. Using the Industries Sales Concierge topic, sales reps can search for products and parts with conversational queries, retrieve pricing from the

standard price book, and find relevant distributors who sell the chosen products or accessories. The agent helps reps pursue sales conversations with out-of-the-box actions for opportunity and quote creation, initiate trade-in requests for existing assets, generate appraisal records, and draft emails.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with the Agentforce for Manufacturing add-on license or included in Agentforce 1 Manufacturing Edition.

Who: To use the Manufacturing Sales Concierge agent topic, users need the Criteria-Based Search and Filter, and Partner Lead Management permission sets.

Why: Sales representatives manage multiple steps across product discovery, distributor selection, opportunity creation, and asset trade-ins. Performing these tasks manually increases effort and slows response times. AI-assisted interactions reduce context switching, convert natural language requests into structured actions, and help sales reps provide faster, more accurate responses to customer requests.

How: In Setup, on the Agentforce Agents page, click **New Agent**. Then, select the Industries Sales Assistance agent template in Agent Builder.

To use the Industries Sales Concierge topic, launch the Agentforce panel, and specify an utterance, such as *"show me products manufactured by Acme Industries"*.

Efficiently Manage Coverages for Proactive Customer Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve proactive customer service by using the enhanced features of the Asset Service Estimation agent topics as part of the Asset Service Management agent. Efficiently select price books for a chosen service work type, the relevant products and their quantities. Choose to specify a different coverage for each product and simplify the process of incorporating asset warranties, entitlements, or service contracts. Create a more enriched quote with the specific discount details for each selected product. Create work orders with an asset's account ID and with the asset name and work type name in the subject.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with the Agentforce for Manufacturing add-on license or included in Agentforce 1 Manufacturing Edition.

Who: To use the Asset Service Estimation topic, users need the Agentforce Default Admin, Scheduler, Einstein For Manufacturing, Industry Service Excellence, Prompt Template Manager, Prompt Template User, and Industries Field Service permission sets.

Why: Manual service estimation processes can be error-prone and slow, particularly when calculating costs with multiple entitlements, warranties, and discounts. The agent streamlines selection of entitlement coverage, applies automated discounts, and calculates prices per quote line item, improving quote accuracy, decision-making, and service efficiency for your users.

How: To give users the ability to manage asset services for customers by using an AI agent, in Setup, on the Agentforce Agents page, click **New Agent**. Then, select the Asset Service Management agent in Agent Builder.

To use the Asset Service Estimation topic, launch the Agentforce panel, and specify an utterance, such as 'Give me repair estimates for this Asset.'

Manufacturing for Sales

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Optimize product sample management and streamline the full lifecycle from request to fulfillment and feedback within a unified ecosystem. Easily manage large sales agreements by viewing up to 20 product lines per page. Use enhanced filters to quickly narrow down associated products, making it faster to track, analyze, and update specific product details.

Sample Management

Streamline the sampling lifecycle with Sample Management to ensure sample requests are complete, governed, and ready for fulfillment. Drive operational efficiency by centrally orchestrating sampling for standard catalog products and capturing detailed requirements for custom products. Track request progress through configurable stage management to improve visibility and control. Reduce manual effort and accelerate requirement processing through document uploads or optional AI-assisted extraction.

Sales Agreements

Easily manage large sales agreements by viewing up to 20 product lines per page. The enhanced filtering capability helps you quickly narrow down the list of associated products, making it faster to track, analyze, and update specific product details in large sales agreements.

Sample Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline the sampling lifecycle with Sample Management to ensure sample requests are complete, governed, and ready for fulfillment. Drive operational efficiency by centrally orchestrating sampling for standard catalog products and capturing detailed requirements for custom products. Track request progress through configurable stage management to improve visibility and control. Reduce manual effort and accelerate requirement processing through document uploads or optional AI-assisted extraction.

Orchestrate Sample Requests for Standard Products

Simplify the sampling process for standard catalog products configured as samples by creating requests directly from opportunities, leads, visits, or sales agreements. Add products quickly through a guided flow, referencing price books to support accurate product selection. Monitor request status using configurable stage management for timely approvals and controlled sample distribution.

Streamline Custom Product Requirements Capture

Capture custom product requirements either using the sample request workflow or independently. Track details like size and material alongside nonfunctional needs such as performance or compliance, while maintaining a clear version history for transparency. Improve efficiency and reduce manual effort by uploading requirement documents and optionally using Generative AI to extract and auto-populate specification details for faster review.

Orchestrate Sample Requests for Standard Products

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Sales Agreements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Easily manage large sales agreements by viewing up to 20 product lines per page. The enhanced filtering capability helps you quickly narrow down the list of associated products, making it faster to track, analyze, and update specific product details in large sales agreements.

Review Large Sales Agreements Faster with Increased Page Size

Speed up the review and update process for your large Manufacturing Sales Agreements (MSAs) by increasing the number of product lines displayed per page from 5 to up to 20. This higher page size reduces the number of page loads required to view full agreements and significantly improves visibility across large MSAs.

Locate Products Faster with Improved Sales Agreement Filters

Managing large volumes of products within Sales Agreements often requires users to narrow down information quickly and focus on specific products, schedules, or metrics. The enhanced filter capabilities make this easier by allowing users to apply multiple, precise conditions directly on the Sales Agreement data grid. Users can filter by product lines, schedules, and any field corresponding to Sales Agreement Product Schedules, including custom fields, to view only the data most relevant to their updates. This improvement supports faster navigation, more targeted updates, and greater efficiency when working with Sales Agreements.

Review Large Sales Agreements Faster with Increased Page Size

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Speed up the review and update process for your large Manufacturing Sales Agreements (MSAs) by increasing the number of product lines displayed per page from 5 to up to 20. This higher page size reduces the number of page loads required to view full agreements and significantly improves visibility across large MSAs.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Manufacturing enabled.

Who: This feature is available to users with the Manufacturing Sales Agreements permission set.

Why: When sales agreements include a large number of products, a fixed view requires extensive page navigation and clicking, which is time-consuming for reviewers. By allowing users to see more records in a single view, this enhancement minimizes navigation effort and accelerates the management of agreements with many products.

Locate Products Faster with Improved Sales Agreement Filters

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Managing large volumes of products within Sales Agreements often requires users to narrow down information quickly and focus on specific products, schedules, or metrics. The enhanced filter capabilities make this easier by allowing users to apply multiple, precise conditions directly on the Sales Agreement data grid. Users can filter by product lines, schedules, and any field corresponding to Sales Agreement Product Schedules, including custom fields, to view only the data most relevant to their updates. This improvement supports faster navigation, more targeted updates, and greater efficiency when working with Sales Agreements.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Manufacturing enabled.

Who: This feature is available to users with the Manufacturing Sales Agreements permission set license.

How: To use the enhanced filters, navigate to the Sales Agreement data grid. Apply filter conditions directly using the new filtering interface. Make sure that you're not using the legacy view to access these enhanced capabilities.

Manufacturing for Services

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance operational efficiency with new capabilities that streamline inventory management. Allocate and count inventory with greater accuracy, manage time sheets, and accelerate recall handling with pre-built templates.

Access Claims from Product Service Campaign Items

View claims on a product service campaign item record. Assign a related list and access the claims associated with a particular product service campaign item.

Associate Assets to Fleets Faster

Easily associate assets to a new fleet or an existing fleet, from a fleet record page, or an asset list view. Search for assets using Criteria-Based Search and Filter and assign them immediately to an existing fleet based on the search result. Ensure efficient fleet management, optimizing workflows for fleet managers and inventory specialists.

Manage Appraisals on Experience Cloud Sites

Users can now streamline equipment inspections with Trade-In Appraisal Management on Experience Cloud sites. Extend the data model by building your own integrations with external systems to fetch asset valuation information.

Manage Asset Recall Inquiries Using Prebuilt Service Templates

Use prebuilt service process templates to handle asset-related recall inquiries, such as eligibility questions or dealer appointment details. These templates help Original Equipment Manufacturers (OEMs) accelerate implementations, enabling faster deployments and improving operational efficiency. Easily view the list of assets for the selected customer account, check whether a specific asset is part of an active recall, and share details of the relevant authorized service partners. A case is created and automatically closed post fulfillment of the service process request and an email is sent to the customer with the relevant recall inquiry details.

Simplify Inventory Counting Across Parent and Child Locations

Perform inventory counts across hierarchical structures, such as warehouses or service fleets, without creating separate plans for each room, aisle, or field service vehicle. Using the Location Hierarchy, you can easily define parent and child locations, so selecting a parent location in a plan automatically displays all its associated child locations. Inventory managers can then select child locations and bulk add or choose product items to create a single, comprehensive inventory count plan.

Optimize Timesheet and Labor Cost Management

Associate assets with timesheets and capture detailed information by using configurable forms. Technicians can update verified timesheets to maintain accuracy, while supervisors and admins control the visibility of entry fields to match operational needs. Additionally, service resources can use Agentforce to handle time-tracking tasks like creating and verifying timesheets.

Access Claims from Product Service Campaign Items

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

View claims on a product service campaign item record. Assign a related list and access the claims associated with a particular product service campaign item.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Product Service Campaign Management, Unified Catalog, Industries Service Excellence, and Industries Field Service enabled.

Who: To use this feature, users need the Product Service Campaign, Industry Service Excellence, and Unified Catalog Admin permission sets.

Associate Assets to Fleets Faster

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Easily associate assets to a new fleet or an existing fleet, from a fleet record page, or an asset list view. Search for assets using Criteria-Based Search and Filter and assign them immediately to an existing fleet based on the search result. Ensure efficient fleet management, optimizing workflows for fleet managers and inventory specialists.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Manufacturing enabled.

Manage Appraisals on Experience Cloud Sites

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Users can now streamline equipment inspections with Trade-In Appraisal Management on Experience Cloud sites. Extend the data model by building your own integrations with external systems to fetch asset valuation information.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Manufacturing, Appraisal Management, and Manufacturing Components for Appraisal Management enabled.

Who: To use this feature, users need the Manage Appraisals and Valuations user permission.

Manage Asset Recall Inquiries Using Prebuilt Service Templates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use prebuilt service process templates to handle asset-related recall inquiries, such as eligibility questions or dealer appointment details. These templates help Original Equipment Manufacturers (OEMs) accelerate implementations, enabling faster deployments and improving operational efficiency. Easily view the list of assets for the selected customer account, check whether a specific asset is part of an active recall, and share details of the relevant authorized service partners. A case is created and automatically closed post fulfillment of the service process request and an email is sent to the customer with the relevant recall inquiry details.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Product Service Campaign Management, Unified Catalog, Industries Service Excellence, and Industries Field Service enabled.

Who: To use this feature, users need the Product Service Campaign, Industry Service Excellence, and Unified Catalog Admin permission sets.

Why: To address the need for quick implementations, these prebuilt templates simplify the setup of various service processes. This focus on rapid deployment ensures a quicker time to market for OEMs by

reducing manual configuration and improving operational efficiency.

How: On an Account page, initiate a recall inquiry request from the Action Launcher.

Simplify Inventory Counting Across Parent and Child Locations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Perform inventory counts across hierarchical structures, such as warehouses or service fleets, without creating separate plans for each room, aisle, or field service vehicle. Using the Location Hierarchy, you can easily define parent and child locations, so selecting a parent location in a plan automatically displays all its associated child locations. Inventory managers can then select child locations and bulk add or choose product items to create a single, comprehensive inventory count plan.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Manufacturing enabled.

Who: This feature is available to users with the Inventory Count Manager and Inventory Count User permission sets.

Why: Previously, an Inventory Manager had to create a separate inventory count plan for every location where inventory was stored. For organizations with a high number of child locations such as a warehouse with hundreds of rooms, this was time-consuming and error-prone. This enhancement reduces administrative effort by allowing inventory managers to define a single, overarching plan at the parent location.

Optimize Timesheet and Labor Cost Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Associate assets with timesheets and capture detailed information by using configurable forms. Technicians can update verified timesheets to maintain accuracy, while supervisors and admins control the visibility of entry fields to match operational needs. Additionally, service resources can use Agentforce to handle time-tracking tasks like creating and verifying timesheets.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Manufacturing enabled.

Allocate Inventory Efficiently Across Locations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage inventory allocation for sales orders and work orders across multiple locations with accurate, real-time visibility. View stock statuses, such as on-hand, allocated, and available, and soft-reserve inventory for specific orders. Assign inventory to orders to prevent overcommitment, and maintain accurate inventory visibility, even during high-volume, concurrent transactions. This helps prevent stock conflicts, improves tracking accuracy, and supports smarter, more efficient fulfillment decisions.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Manufacturing enabled.

Who: This feature is available to users with the Inventory Allocation and Inventory Search and Transfer permission sets.

Why: Tracking only the total on-hand quantity is often insufficient and can lead to over-promising and inaccurate order fulfillment. Allocating inventory with full visibility into inventory statuses allows you to clearly identify which portion of stock is truly available for new orders and which portion is already soft-reserved for existing commitments. This improves order fulfillment accuracy and supports more reliable operations.

How: Add the Inventory Allocation component to the Order and Work Order pages to view and create allocations for products available as line items.

Enhance Search Experience with Criteria-Based Search and Filter

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Criteria-Based Search and Filter (CBSF) now provides a more intuitive and reliable search experience with consistent data display and clear visibility into when data was last updated. Date-time fields appear in the

user's timezone using standard Salesforce formatting, and currency fields display symbols instead of codes. Any Word Search is enabled by default in all orgs, and users can view the Last Refreshed Date for search results, enhancing clarity and efficiency.

Where: This change applies to Lightning Experience in all editions with Criteria-Based Search and Filter.

Who: This feature is available to users with the Criteria-Based Search and Filter system permission.

How: These changes are automatically applied to the CBSF user interface, including the use of local timezone formatting for date-time fields (e.g., 10/25/2024, 2:36 PM) and currency symbols (e.g., \$) instead of currency codes.

For administrators, to enable the Last Refreshed Date display, link the searchable object configuration to the Data Processing Engine (DPE) that populates the flat entity data. The date will then appear at the top of the search results.

Extend Stage Management to Additional Manufacturing Objects

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Implement stage management across more Manufacturing objects such as Asset, Fleet, Appraisal, Appraisal Item, Product Service Campaign Group Definitions and Product Service Campaign Group Causal Item. Provide a structured, traceable, and controlled process for managing the life-cycle of Manufacturing business operations through defined stages. Maximize service efficiency, reduce turnaround time, and enhance customer lifetime value.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Manufacturing enabled.

Optimize Channel Operations with Enhanced Channel Revenue Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Channel Revenue Management now provides enhanced control and efficiency across partner inventory and incentive programs. New features include Stock Rotation Incentives, allowing partners to return or scrap aging stock for rotation credits, while maintaining financial control through precise budget allocation and tracking. Incentive budgets can now be defined, allocated, and monitored across partners and programs. Operational efficiency is improved with integrated workflows for partner submission, eligibility validation, claim creation, and budget tracking.

Access Manufacturing Features and Setup in One Place

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce Go now supports a broader range of Manufacturing features that you can configure and manage from a single location in Setup. Implement features faster, reduce context switching, and simplify setup across your org.

With Salesforce Go, you can discover, set up, and configure key Manufacturing features for Warranty Claims, Inventory Management, Sample Management, and Partner Engagement from one place with guided support. Easily enable Manufacturing Agentforce templates and Einstein for Manufacturing to enhance sales and operational intelligence, and streamline service operations by setting up Service Lifecycle Management and related components. Easy access to help content and setup resources makes it simple to learn about features and complete configuration. For more details on how to discover and configure features with Salesforce Go, see [Salesforce Help: Discover and Set Up Features with Salesforce Go](#)

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions.

New and Changed Objects for Manufacturing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manufacturing includes these new and changed objects.

New Objects

Represent information about the status of the inventory reservations.

Use the new *Inventory Reservation* object.

Represent inventory item reservation information for a specific product and location.

Use the new *Inventory Item Reservation* object.

Represent an individual transaction that records a change in the state and quantity of a specific product item.

Use the new *Product Item Additional Transaction* object.

Represent a request for product samples, including customer account details, request date, and status.

Use the new *Sample Request* object.

Represent sample or custom specification details associated with a sample request, including quantity, price, and cost information.

Use the new *Sample Request Item* object.

Represent a complete set of product requirements, including associated account and contact information, lifecycle status, and relationships to requirement items and their versions.

Use the new *Product Requirement Specification* object.

Represent a specific, measurable requirement within a requirement specification, defining delivery expectations and verification criteria for a requested product.

Use the new *Product Requirement Specification Item* object.

Represent a specific version of a requirement specification, capturing its purpose, scope, constraints, and validation methods at a given point in time.

Use the new *Product Requirement Specification Version* object.

Changed Objects

Store the quantity of product items that are allocated but not yet shipped.

Use the new field *Quantity Allocated* on Product Item.

Store the quantity of product items that are currently available in inventory.

Use the new field *Quantity Available* on Product Item.

Store the date and time when the quantity status of the product item was last updated.

Use the new field *Quantity State Refresh Date* on Product Item.

Media

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline the setup process for Agentforce Media features such as Advertising Inventory Management and media plans through Salesforce Go's centralized dashboard. Streamline workflows by processing line items individually and refreshing media grids instantly. Manage audio and video ad spots precisely with dedicated maximum ad runtimes and skippable options. Maximize campaign precision with advanced inclusion rules, granular postal code options, and MuleSoft Direct enhancements for Google Ad Manager. Use enhanced Salesforce Documentation Generation capabilities to create larger pitch decks and create quotes for customers across multiple geographical locations.

Media Cloud is now Agentforce Media. You may see references to Media Cloud in our application and documentation.

Accelerate Discovery and Setup of Media Cloud Features

Accelerate time-to-value by using Salesforce Go's intuitive setup platform. Save time by centralizing all critical configuration tasks for Advertising Inventory Management, Revenue Schedules for Media, Media Proposals, and Media Plans in one comprehensive dashboard. Access the integrated content resources and links for continuous learning and configuration support.

Streamline Your Workflow with Instant Processing and Real-Time Updates

Accelerate your workflow by processing line items individually, enabling immediate interaction without the delay of waiting for all tasks to complete together. Improve the interface's responsiveness by using platform events to refresh media grids instantly as updates happen.

Boost Advertising Sales Management with Instant Inventory Insight and Granular Campaign Control

Get instant visibility into inventory levels with clear availability status indicators for every media plan. Create custom picklist values for the availability status, such as Available, Not Available, and Partially Available. Gain granular control over your video and audio campaigns by capturing the maximum ad duration and skippable settings, directly within the Line Item Details tab. Streamline your workflow with conditional UI rendering, ensuring you only see these new fields when configuring video or audio products.

Improve Ad Campaign Precision with Advanced Targeting and MuleSoft Direct Enhancements

Maximize the advertising campaign precision through advanced inclusion and exclusion rules for targeting, such as geo-targeting, inventory targeting, and custom targeting. Improve targeting accuracy

with granular postal code options and support for ad space groups (placements). Use the MuleSoft Direct enhancements to allow Google Ad Manager to use the improved targeting and grouping capabilities in Advertising Sales Management.

Generate Larger Pitch Decks with Salesforce Document Generation

Expand your media proposal capabilities with new support for document files up to 200 MB. Generate larger and detailed pitch decks with confidence. Experience optimized performance and flexibility when compiling your most data-intensive media proposals through pitch decks.

Generate Quotes for Customers in Multiple Locations (Pilot)

Manage complex, large-scale quotes for customers with ease. Your sales representatives can group locations, apply products to entire groups simultaneously, and price quotes for multiple geographical locations efficiently.

Connect REST API Enhancements

Availability Status Mapping

Added ratio-based **AvailabilityStatus** mapping through **AdAvailsConfig** to set the status and icon on AdQuoteLine.

Targeting Inclusion Flag

Added **isIncluded** (true/false) support to include or exclude targeting in MuleSoft Direct for Google Ad Manager.

Ad Space Group Support

Added **isGroup** (true/false) to **adSpaceSpecifications**. Mule maps it to **adUnitId** or **targetedPlacementIds**, and ASM maps identifiers to **adUnitId** (Ad Space) or **placement_id** (Ad Space Group).

Postal Code Targeting

Added postal code support to targeting in API specifications. Mule maps the postal codes to Google Ad Manager **geoTargeting**.

MaxDuration and Skippable Support

Added **MaxDuration** and **Skippable** for video/audio **AdQuoteLine** items. The UI captures these values, and the API sends them as **digitalAttributes**.

Net Zero

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Learn about the latest features from Agentforce Net Zero, formerly Net Zero Cloud, that enhance data management, accounting, reporting, and sustainability insights. Scale your Agentforce Net Zero data management by using the ESG Data Collection Agent, powered by generative AI. Centralize environmental, social, and governance (ESG) data from multiple Salesforce orgs into a single source of truth in Data 360. Streamline the process of tracking and reporting Fuel and Energy-Related Activities (FERA) emissions and Transmission and Distribution (T&D) losses under Scope 3 Category 3. Extend Data 360 capabilities by accessing all data model objects (DMOs) and calculated fields.

Net Zero Cloud is now Agentforce Net Zero. You may see references to Net Zero Cloud in our application and documentation.

[Agentforce for Net Zero](#)

Use agents powered by generative AI to scale Net Zero Cloud Manager. The ESG Data Collection Agent engages with multiple stakeholders and collects information for environmental, social, and governance.

[Enable Agentforce Net Zero Features Across All Dataspaces in Data Cloud One](#)

Create a single source of truth for your environmental, social, and governance (ESG) data by

connecting multiple Salesforce orgs to a central Data 360 org. With Data Cloud One architecture, a Salesforce admin configures one home org and multiple companion orgs. This architecture helps organizations with complex configurations avoid data silos and fully leverage Agentforce Net Zero, formerly Net Zero Cloud, capabilities. Turn on Einstein Search for Net Zero Cloud and create specific prompts for each dataspace to unify your data and enhance reporting.

Simplify FERA Emissions Reporting for Scope 3 Category 3 Compliance

Streamline the process of tracking and reporting Fuel and Energy-Related Activities (FERA) emissions and Transmission and Distribution losses under Scope 3 Category 3. You can now calculate and report both direct and upstream emissions from fuel and energy consumption for stationary and mobile assets, including electric vehicles, without creating duplicate energy use records. This feature aligns with the Greenhouse Gas Protocol and Corporate Sustainability Reporting Directive requirements.

Improve Emissions Reporting for Leased Assets in Agentforce Net Zero

Automatically assign emissions for stationary fuel combustion in leased assets to the appropriate scope 3, GHG category 8 Upstream Leased Assets. Use Agentforce Net Zero, formerly Net Zero Cloud, to manage your environmental impact, align with Greenhouse Gas Protocol standards, and prevent misstated emissions data.

Support All Quantitative Metrics for CSRD Reporting

Support all required quantitative metrics for European Sustainability Reporting Standards (ESRS) E2, E3, E4, and E5 in your Corporate Sustainability Reporting Directive disclosures by using the enhanced data model and data mappers. This feature provides comprehensive assistance for your environmental, social, and governance reporting.

Generate Consolidated Reports for Your Entire Organization

Generate a report that consolidates environmental, social, and governance metrics from your parent company and its subsidiaries. Streamline the reporting process while meeting both regulatory and voluntary reporting needs efficiently.

Perform Advanced Environmental Data Analysis in Data 360

Extend Data 360 capabilities by accessing all data model objects and calculated fields. This feature enables sustainability managers to perform detailed scenario modeling and operational analysis by using the audit-grade environmental accounting and reporting capabilities.

Enhance Emission Allocation with Category-Level Mappings

Specify category-level mappings for emission allocations between child and parent organizations. You can then prepare more granular and accurate emissions reports, so that the data reflects the true impact of each entity within the organizational hierarchy.

Use agents powered by generative AI to scale Net Zero Cloud Manager. The ESG Data Collection Agent engages with multiple stakeholders and collects information for environmental, social, and governance.

Use Agentforce to Engage with Multiple Stakeholders to Collect ESG Data: ESG Data Collection

Use the ESG Data Collection Agent to engage with multiple stakeholders and collect environmental, social, and governance (ESG) information. Based on the query, collect the data through the agent actions, process the information, and take further actions.

Use Agentforce to Engage with Multiple Stakeholders to Collect ESG Data: ESG Data Collection

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the ESG Data Collection Agent to engage with multiple stakeholders and collect environmental, social, and governance (ESG) information. Based on the query, collect the data through the agent actions, process the information, and take further actions.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with the Net Zero Cloud Growth license or the Net Zero Cloud User add-on license and the Agentforce for Net Zero Cloud add-on license. Einstein generative AI is available in Lightning Experience.

To purchase the Agentforce for Net Zero Cloud add-on, contact your Salesforce account executive.

How: From Setup, in the Quick Find box, enter *Agents Setup*, and then select **New Agent**. Then create the ESG Data Collection agent based on the Agentforce Employee Agent template and follow the guided setup steps.

Enable Agentforce Net Zero Features Across All Dataspaces in Data Cloud One

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create a single source of truth for your environmental, social, and governance (ESG) data by connecting multiple Salesforce orgs to a central Data 360 org. With Data Cloud One architecture, a Salesforce admin configures one home org and multiple companion orgs. This architecture helps organizations with complex configurations avoid data silos and fully leverage Agentforce Net Zero, formerly Net Zero Cloud, capabilities. Turn on Einstein Search for Net Zero Cloud and create specific prompts for each dataspace to unify your data and enhance reporting.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and Developer editions with the Net Zero Growth license and Data 360.

Simplify FERA Emissions Reporting for Scope 3 Category 3 Compliance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline the process of tracking and reporting Fuel and Energy-Related Activities (FERA) emissions and Transmission and Distribution losses under Scope 3 Category 3. You can now calculate and report both direct and upstream emissions from fuel and energy consumption for stationary and mobile assets, including electric vehicles, without creating duplicate energy use records. This feature aligns with the Greenhouse Gas Protocol and Corporate Sustainability Reporting Directive requirements.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and

Developer editions with the Net Zero Growth license.

Improve Emissions Reporting for Leased Assets in Agentforce Net Zero

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Automatically assign emissions for stationary fuel combustion in leased assets to the appropriate scope 3, GHG category 8 Upstream Leased Assets. Use Agentforce Net Zero, formerly Net Zero Cloud, to manage your environmental impact, align with Greenhouse Gas Protocol standards, and prevent misstated emissions data.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and Developer editions with the Net Zero Growth license.

Enhance Emission Allocation with Category-Level Mappings

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Specify category-level mappings for emission allocations between child and parent organizations. You can then prepare more granular and accurate emissions reports, so that the data reflects the true impact of each entity within the organizational hierarchy.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and Developer editions with the Net Zero Growth license.

How: From Setup, in the Quick Find box, enter *Net Zero Settings*, and then select **Net Zero Settings**. Turn on Manage Carbon Accounting. To create an organizational hierarchy for a parent organization and one level of child organizations, turn on Two-Level Organizational Hierarchy. To create an organizational hierarchy for a parent organization and multiple levels of child organizations, turn on Multilevel Organizational Hierarchy.

New and Changed Objects in Agentforce Net Zero

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with the new and changed Agentforce Net Zero, formerly Net Zero Cloud, objects.

Changed Objects

Note If you're an existing customer and don't see the new or changed fields, ask your Salesforce admin to add the fields in the page layout of the respective objects.

Streamline the process of tracking and reporting Fuel and Energy-Related Activities (FERA) emissions and Transmission and Distribution losses under Scope 3 Category 3

Use the `Scp3MktFuelEnergyOverride` and `Scope3EmissionsType` fields on the `AnnualEmssnInventory` object.

Use the `Scp3MktEmssnFuelEnergy` field on the `StnryAssetCrbnFtprnt` object.

Use the `Scp3EmssnFuelEnergy`, `Scp3MktEmssnFuelEnergy`, `Scp3Ch4EmssnFuelEnergy`, `Scp3Co2EmssnFuelEnergy`, `Scp3N2oEmssnFuelEnergy`, `ElectrLifecyclEmssnFctrSetId`, and `OthrLifecyclEmssnFctrSet` fields on the `StnryAssetEnergyUse` object.

Use the `ElectrLifecyclEmssnFctrSet` and `OthrLifecyclEmssnFctrSet` on the `StnryAssetEnvrSrc` object.

Use the `Scp3EmssnFuelEnergy` field on the `VehicleAssetCrbnFtprnt` object.

Use the `OthrLifecyclEmssnFctrSet` field on the `VehicleAssetEmssnSrc` object.

Use the `Scp3EmssnFuelEnergy`, `Scp3Ch4EmssnFuelEnergy`, `Scp3Co2EmssnFuelEnergy`, `Scp3Co2EmssnFuelEnergy`, and `OthrLifecyclEmssnFctrSet` fields on the `VehicleAssetEnergyUse` object.

Use the `AllocScp3MktEmssnFuelEnergy` field on the `AnnualEmissionInventoryExtension` object.

New Objects

Store information about the emissions factors used to calculate greenhouse gas emissions that occur throughout the lifecycle of electricity

Use the new Electricity Lifecycle Emission Factor Set object.

Store a collection of emissions factors used to calculate emissions that occur throughout the fuel lifecycle, from extraction to end-of-life

Use the new Other Lifecycle Emission Factor Set object.

Store the individual emissions factor for a fuel used to calculate emissions that occur throughout its lifecycle, from extraction to end-of-life

Use the new Other Lifecycle Emission Factor Set Item object.

Public Sector

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Transform IT service delivery with Agent-First IT Support for Public Services. Accelerate hiring and simplify license discovery with Agentforce. Streamline investigative case management setup by using Salesforce Go, collect fees directly on your portal with Inbound Payments, and support complex reporting needs by generating larger documents.

Public Sector Solutions is now Agentforce Public Sector. You may see references to Public Sector Solutions in our application and documentation.

Deliver Agent-First IT Support to Public Sector Employees

Provide modern, AI-powered IT service management to your public sector employees with the full suite of Agentforce IT Service capabilities. Resolve issues faster by giving your employees conversational, personalized, AI-driven support in the most convenient channel. Accelerate self-service by using topics and actions provided in the Employee Request Management agent template. Use the topics and actions in the IT fulfiller agent template to reduce repetitive manual work and accelerate issue resolution. Use Data 360 to enrich responses and reduce manual intervention for routine tasks.

Agentforce for Public Sector

Accelerate hiring by using an AI agent to match qualified candidates to job positions based on skills, specializations, and location. Assist job seekers on your recruitment site with an agent that answers questions about hiring policies and processes. Help constituents identify necessary licenses and permits and answer their questions by deploying an agent grounded in your agency's policy manuals.

Enhance Benefit Assistance with Comprehensive Data

Capture essential details about a constituent, such as living arrangements and benefit duration, to help caseworkers make informed decisions about their benefit eligibility. Use eligibility reason codes to track eligibility determination, and record key dates of benefit issuance, closure, and notification to support the benefit assistance lifecycle.

Collect Fees for Public Sector Services with Inbound Payments

Help constituents pay for services, such as license and permit applications, directly on your public facing portal. By using Inbound Payments, you can embed a secure checkout flow into your Experience Cloud site. This integration helps constituents settle fees digitally and gives agency employees real-time visibility into payment status, reducing manual reconciliation and ensuring compliance before application approval.

Generate Larger Documents for Agentforce Public Sector

Generate documents up to 300 MB to help with complex reporting needs, like investigative case files with high-resolution images or large data records. Agentforce Public Sector, formerly Public Sector Solutions, now packages this enhancement directly, so you can create large files without hitting

previous size constraints.

Enhance Agentforce Public Sector Feature Discovery and Setup

With Salesforce Go, discover, set up, and configure Investigative Case Management features, and track feature usage, all from a single location in Setup. Learn more about the features and get help with configuration by accessing content resources and links.

New and Changed Objects in Agentforce Public Sector

Do more with the new and changed Agentforce Public Sector, formerly Public Sector Solutions, objects.

New APIs in Agentforce Public Sector

Do more with the new API in Agentforce Public Sector, formerly Public Sector Solutions, objects.

New and Enhanced Common Features for Public Sector Solutions

Agentforce Public Sector includes access to some features that are available across clouds and products in Industries. Use these features to extend and customize Agentforce Public Sector based on your business needs.

- **Action Launcher**
Extend action recommendations by using contextual information from service records to determine user intent.
- **Action Plans**
Customize the quick actions on an action plan template record page. Include document checklist items in actions plans for financial accounts. Learn about the life events in a client's household at a glance.
- **Actionable Relationship Center**
View many-to-one relationship type records on an Actionable Relationship Center (ARC) graph.
- **Batch Management**
Use related object fields to control eligibility criteria and to group records for processing. Make the most of the new enhancements to fast-track batch job runs. All Spring '26 Batch Management changes are available for a limited set of process types, excluding the Flow process type.
- **Batch Management**
Experience improved scalability in decision tables with increased limits for invocations, output results, columns, and row processing. Expression sets enhancements include support for the IF function, automatic element naming, proactive alerts for constraint violations, and improved Salesforce Flow integration. Deploy rules to context definitions with improved stability. Monitor decision table actions in a centralized dashboard with real-time status and error details. Simplify the discovery and setup Business Rules Engine features with Salesforce Go. Clarify decisions with automated explanations for nested expression sets. Control how your expression set handles null values and no matches in decision tables based on your business requirements.
- **Compliant Data Sharing**
Compliant Data Sharing custom object record owners can now delete custom object participant records by using a new setting.
- **Context Service**
Manage large context definitions with more ease by using the enhanced context definition mapping

user interface with inline search and improved sort and filter abilities. Map extended context definitions to custom data spaces that contain preprocessed, harmonized, and unified data from multiple sources. Context Service now supports Second-Generation Managed Packaging (2GP). You can now package and deploy deactivated context definitions. Guided extensibility prevents mapping conflicts by enabling custom mappings only for allowed inherited nodes and attributes, ensuring stable upgrade experiences.

- [Criteria-Based Search and Filter](#)

Use Criteria-Based Search and Filter to design a search experience for your users. You can configure a search based on a single object that unifies complex sets of data, such as inventory and aggregated customer information that's otherwise spread across multiple objects and fields. Criteria-Based Search and Filter can be customized to meet varied business requirements.

- [Discovery Framework](#)

Easily present forms in the user's preferred language by storing assessment questions and responses in multiple languages. Keep historical data accurate by mapping each response to the specific version of the question, ensuring compliance. Save time by creating assessment questions with Generative AI so that you can generate, edit, and refine questions by using natural language instructions.

- [Data Processing Engine](#)

Preview how your definitions transform data and instantly validate and debug definition design right for the builder. Create and run definitions in Data 360 companion orgs. Use a unified view to track the performance and key metrics of definitions. Get actionable recommendations for failed runs and download failed records to debug faster. Find and focus the Data Processing Engine canvas on nodes that you want to work on.

- [Fundraising](#)

Give your staff and donors powerful tools for managing gifts. Donors can handle common requests, like changing recurring gifts, by using the self-service Donor Support Agent (beta). Free up your staff by customizing the Gift Entry Grid with templates and custom Lightning Web Components for faster processing. You can now add up to 50 designations to a single gift and backdate transactions for gift commitments, all from within the Gift Entry Grid. New object updates also help you track in-kind donations and add multiple designations. Streamline workflows, improve data accuracy, and provide Relationship Officers with clear, gift-specific views, with dynamic Flexcards for gift planning.

- [Grantmaking](#)

Adopt the Application Form object to future-proof your application process and ensure access to future platform enhancements. To improve completion rates, all form components are now mobile-friendly for a better user experience on any device. You can also require specific file attachments to prevent incomplete applications.

- [Interest Tags](#)

Use sharing rules to extend sharing access to users for Tag Categories.

- [Omnistudio](#)

Validate your workflows built with Omniscripts and Flexcards end-to-end by using the UI Test Automation Model (UTAM) framework. For a fast, scalable experience, add Omniscripts and Flexcards to Lightning Web Runtime (LWR) Experience Cloud sites (pilot). Get immediate help with an Omnistudio component or element with the Omnistudio Assistance AI Agent (pilot). With accessibility improvements for Omniscripts and Flexcards, create inclusive workflows and solutions for customers and users with disabilities. Filter empty records in Omnistudio Data Mapper Extract and Turbo Extract components with the Is Null operator.

- [Program and Case Management](#)

Manage the complete participant lifecycle with greater speed and accuracy. Potential participants can now browse programs as guest users on your Experience Cloud site to increase engagement. When participants apply, guide staff through a streamlined intake for one or many programs with real-time eligibility checks. Finally, capture service delivery faster with optimized mobile attendance tracking and accelerate your Data 360 readiness with updated data kits.

- [Rollup Definitions](#)

Configure multiple record rollup definitions within one LWC component for improved data visualization. Set up on-demand record rollup definitions quickly and efficiently using the guided setup. Help business executives make more informed decisions by using the enhancements to record rollup definitions.

Deliver Agent-First IT Support to Public Sector Employees

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Provide modern, AI-powered IT service management to your public sector employees with the full suite of Agentforce IT Service capabilities. Resolve issues faster by giving your employees conversational, personalized, AI-driven support in the most convenient channel. Accelerate self-service by using topics and actions provided in the Employee Request Management agent template. Use the topics and actions in the IT fulfiller agent template to reduce repetitive manual work and accelerate issue resolution. Use Data 360 to enrich responses and reduce manual intervention for routine tasks.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions where Public Sector Solutions is enabled with:

- Agentforce for Public Sector
- Employee Experience for Public Sector
- Public Sector Foundation - Advanced
- Public Sector - Service - Agentforce 1 Edition

Who: Agentforce Public Sector, formerly Public Sector Solutions, employee users who are fulfillers, incident managers, and major incident managers use the permission sets provided by Agentforce for IT Service. Users who are employee requestors require additional permission sets.

Agentforce for Public Sector

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Accelerate hiring by using an AI agent to match qualified candidates to job positions based on skills, specializations, and location. Assist job seekers on your recruitment site with an agent that answers questions about hiring policies and processes. Help constituents identify necessary licenses and permits and answer their questions by deploying an agent grounded in your agency's policy manuals.

Discover Licenses and Permits and Answer FAQs with Agentforce

Help constituents identify the licenses, permits, and inspections they need for their business or personal goals by interacting with an AI agent on your License and Permit portal. Grounded in your agency's policy manuals, the agent answers FAQs to reduce agency workload. It asks prescreening questions to understand constituents' needs and guides them through the pre-application process, reducing the number of incorrect submissions.

Speed Up Candidate Sourcing with Agentforce Skill Matching

Accelerate hiring by quickly surfacing qualified talent based on specialized skills for quicker review and decision-making. The agent helps recruiters identify candidates for a job position by matching specific skillsets and job specializations. The agent creates leads for the shortlisted candidates to track outreach, and sends emails inviting them to apply.

Answer Job Seeker Questions Instantly with Agentforce

Help job seekers learn about your agency's mission, hiring policies, and processes by interacting with an AI agent on your recruitment Experience Cloud site. Grounded in your policy manuals, the agent provides accurate responses to candidate inquiries. Candidates can ask follow-up questions to refine results, which helps them understand expectations and saves recruiters from answering repetitive questions.

Discover Licenses and Permits and Answer FAQs with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help constituents identify the licenses, permits, and inspections they need for their business or personal goals by interacting with an AI agent on your License and Permit portal. Grounded in your agency's policy

manuals, the agent answers FAQs to reduce agency workload. It asks prescreening questions to understand constituents' needs and guides them through the pre-application process, reducing the number of incorrect submissions.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions where Agentforce Public Sector, formerly Public Sector Solutions, is enabled with the Agentforce for Public Sector and Agentforce for Public Sector Community add-ons. Employee use cases also require the Employee Experience for Public Sector add-on.

How: In Setup, configure the agent by using Agentforce and connect it to your Data 360 instance to ingest your unstructured policy manuals. Then, activate the prebuilt Licensing, Permit, and Inspection (LPI) Agent topic so the agent can answer questions about permit discovery by using Data 360's retrieval augmented generation (RAG) capabilities. Also, assess constituent Licensing and Permit needs using the Business Rules Engine (BRE).

Speed Up Candidate Sourcing with Agentforce Skill Matching

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Accelerate hiring by quickly surfacing qualified talent based on specialized skills for quicker review and decision-making. The agent helps recruiters identify candidates for a job position by matching specific skillsets and job specializations. The agent creates leads for the shortlisted candidates to track outreach, and sends emails inviting them to apply.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions where Public Sector Solutions is enabled with:

- Agentforce for Public Sector
- Public Sector - Service - Agentforce 1 Edition

Answer Job Seeker Questions Instantly with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help job seekers learn about your agency's mission, hiring policies, and processes by interacting with an AI agent on your recruitment Experience Cloud site. Grounded in your policy manuals, the agent provides accurate responses to candidate inquiries. Candidates can ask follow-up questions to refine results, which helps them understand expectations and saves recruiters from answering repetitive questions.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions where Agentforce Public Sector, formerly Public Sector Solutions, and Data 360 are enabled, with the Agentforce for Public Sector and Agentforce for Public Sector Community add-ons.

Who: The agent is available to authenticated and unauthenticated job seekers on your recruitment Experience Cloud site.

Why: Candidates often have specific questions about job qualifications or work expectations that static FAQs don't cover. Instead of waiting for a recruiter to respond, candidates can converse with the agent to get consistent information sourced directly from your agency's policy manuals.

How: Upload your agency's policy documents, FAQs, and mission statements to the Agentforce Data Library to vectorize the data. Then, configure the Recruitment FAQ Agent to use this data to ground its responses and add the agent to your recruitment site.

Enhance Benefit Assistance with Comprehensive Data

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Capture essential details about a constituent, such as living arrangements and benefit duration, to help caseworkers make informed decisions about their benefit eligibility. Use eligibility reason codes to track eligibility determination, and record key dates of benefit issuance, closure, and notification to support the benefit assistance lifecycle.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions where Public Sector Solutions is enabled.

Collect Fees for Public Sector Services with Inbound Payments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help constituents pay for services, such as license and permit applications, directly on your public facing portal. By using Inbound Payments, you can embed a secure checkout flow into your Experience Cloud site. This integration helps constituents settle fees digitally and gives agency employees real-time visibility into payment status, reducing manual reconciliation and ensuring compliance before application approval.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions where Agentforce Public Sector, formerly Public Sector Solutions, is active.

Why: Previously, agencies used disparate systems or in-person processing to collect fees, which disconnected payments from application records. With Inbound Payments, you control financial transactions directly within Salesforce. This integration links payments to specific requests, reducing disputes. Compliance officers verify payment completion before authorizing services.

How: In Setup, configure your Service Catalog to define services and associated regulatory fees. Set up your payment gateway, such as Stripe or Adyen, by using Salesforce Payments. Then, add the Payment component to your Experience Cloud Lightning Web Runtime (LWR) site pages to expose the cart and checkout flow to constituents.

Generate Larger Documents for Agentforce Public Sector

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Generate documents up to 300 MB to help with complex reporting needs, like investigative case files with high-resolution images or large data records. Agentforce Public Sector, formerly Public Sector Solutions, now packages this enhancement directly, so you can create large files without hitting previous size constraints.

Where: This change is applicable in Lightning Experience for Enterprise, Performance, Unlimited, and Developer editions that have Agentforce Public Sector enabled.

Why: Previously, file size limits constrained the inclusion of rich media and large datasets. With this increase to 300 MB available out of the box, you can consolidate all necessary information into a single document file.

How: Public Sector Solutions automatically includes this feature.

Enhance Agentforce Public Sector Feature Discovery and Setup

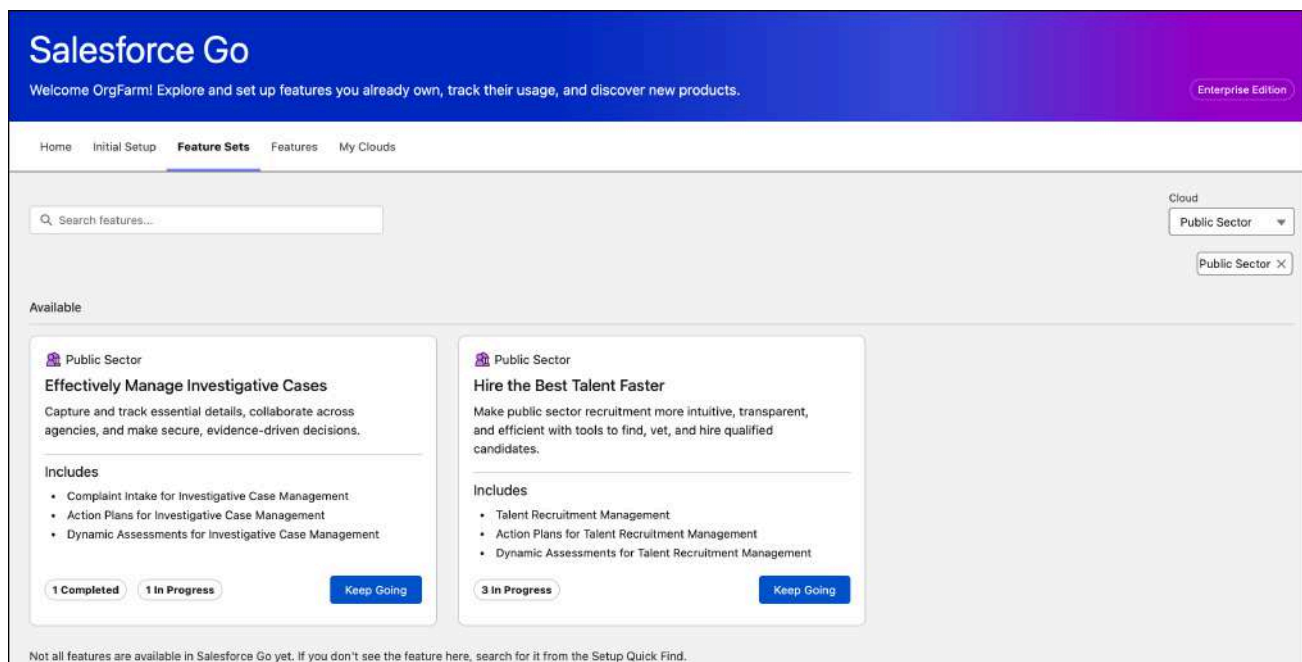

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Salesforce Go, discover, set up, and configure Investigative Case Management features, and track feature usage, all from a single location in Setup. Learn more about the features and get help with configuration by accessing content resources and links.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions where Agentforce Public Sector, formerly Public Sector Solutions, is enabled.

How: From the Setup dropdown, select **Salesforce Go**. Then go to the Effectively Manage Investigative Cases feature set to manage your settings in Go.

Capture the date when the benefit termination notice was delivered

Use the new `TerminationNotificationDate` field on the existing `BenefitAssignment` object.

Capture the reason for terminating the benefit assignment

Use the new `TerminationReason` field on the existing `BenefitAssignment` object.

Store the method for benefit disbursement, such as cheque or bank transfer

Use the new **DisbursementMethod** field on the BenefitDisbursement object.

Associate a regulatory transaction fee with an order item

Use the new **RegulatoryTrxnFeeId** field on the existing OrderItem object.

Capture the ethnicity of the applicant

Use the new **Ethnicity** field on the existing PartyProfile object.

Store the preferred communication method for the applicant, such as email or WhatsApp message

Use the new **PreferredCommunicationMethod** field on the existing PartyProfile object.

Store the housing type of the party relationship group, such as rented, shared home, or self-owned

Use the new **HousingType** field on the existing PartyRelationship object.

Capture the account information of the applicant

Use the new **Account** field on the existing PersonExamination object.

Identify the designated billing contact for a business account

Use the new **BillingContact** field on the existing RegulatoryTrxnFee object.

Add a description to a regulatory transaction fee

Use the new **Description** field on the existing RegulatoryTrxnFee object.

Capture the total amount due for a regulatory transaction fee

Use the new **DueAmount** field on the existing RegulatoryTrxnFee object.

Track the invoicing status of a regulatory transaction fee

Use the new **InvoicingStatus** field on the existing RegulatoryTrxnFee object.

Capture the total amount paid toward a regulatory transaction fee

Use the new **PaidAmount** field on the existing RegulatoryTrxnFee object.

Relate a fee to a parent fee to track disputes, cancellations, or refunds

Use the new **ParentRegulatoryTrxnFee** field on the existing RegulatoryTrxnFee object.

Add a description to a regulatory transaction fee item

Use the new **Description** field on the existing RegulatoryTrxnFeeItem object.

Relate a regulatory transaction fee item to a specific product

Use the new **Product2Id** field on the existing RegulatoryTrxnFeeItem object.

New APIs in Agentforce Public Sector

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with the new API in Agentforce Public Sector, formerly Public Sector Solutions, objects.

Support for Regulatory Transaction Fee (RTF) Adjustments and Refunds

The Recompute API is used when fees are recomputed, disputed, or cancelled. The adjustments to the existing Regulatory Transaction Fees (RTFs) can be positive or negative. For fee corrections, it automatically creates a new RTF against the original RTF and a corresponding new invoice for the adjusted amount. The original RTF is always set as the parent of the new RTF record. There are two types of adjustments:

- Positive adjustments: Creates a new RTF and a new invoice for the additional fee.
- Negative adjustments: Creates a new negative RTF and a new invoice, automatically generates a credit memo against the original invoice, adjusts payments, and processes a refund.

Education

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about the latest features from Agentforce Education, formerly Education Cloud, that boost productivity throughout your organization. Support recruitment, admissions, academic operations, student success, advancement, and alumni engagement with the latest CRM and student information system (SIS) capabilities.

Note Education Cloud is now Agentforce Education. You may see references to Education Cloud in our application and documentation.

Agentforce for Education

Streamline student financial management, offer autonomous transfer credit estimates, strengthen prospect research strategy, and centralize course collaboration within Slack.

Streamline Transfer Credit Evaluations for Students

Create and manage transfer equivalency relationships and the entire transfer credit process from a unified interface that automatically matches and suggests credits. Registrars can use the guided process to review submitted documentation and to articulate credit transfer requests.

Accelerate Transfer Credit Evaluations in the Application Process

Speed up learning equivalency evaluations and reduce student wait time by requesting estimates for transferable credits directly in the application portal. Applicants can enter details of prior learning and upload supporting documents and images in each admissions application. They can also reuse previous estimates to prefill and create official transfer credit requests. When an applicant submits their information, automatically create records and streamline the review process.

Help Students Register for High-Demand Courses Efficiently

Configure course waitlists to simplify the enrollment process and manage the demand for popular courses. Support students to join the waitlists of high-demand courses directly from the Experience Cloud site and notify them when seats open up, reducing the stress of monitoring course availability. Determine student enrollment priority and timing on a dedicated setup page. Send enrollment offers to students by using prebuilt flows. Students can accept or decline an offer to enroll, or remove themselves from waitlists.

Configure Educational Characteristics to Enforce Eligibility Checks During Course Registration

Clearly communicate eligibility criteria to students during course registration. Configure complex eligibility logic on learning courses by using a flexible and scalable framework. Define and assign identity-based attributes to students, such as major, cohort, or honors status, that tie to specific time frames. Automatically evaluate student attributes against eligibility criteria to enforce enrollment rules. Show students the required educational characteristics of each course to help them make informed decisions. Maintain accurate enrollment data and comply with institutional policies.

Simplify Appointment Scheduling Setup in Agentforce Education

System administrators get clear guidance at every stage to quickly set up appointment scheduling topics, assign staff, and complete all prerequisite steps. This feature drastically cuts down on configuration time and reduces errors. Staff members now have a simplified experience to manage their own and their colleagues' availability with a few clicks. Institutions can configure scheduling quickly and accurately by using intuitive guidance and education-aligned language.

Gain Trusted Education Insights with a Unified Semantic Layer

Use the Tableau Semantic Layer to organize your data into a single, reusable model. This shared layer calculates metrics consistently across Tableau Next components, Agents, and Marketing Cloud Growth campaigns. With one trusted source of truth, teams can analyze performance, generate data, and make decisions with confidence.

Empower Advisors to Help Students with Personalized Career and Goal Planning

Provide personalized guidance and help students define and achieve career and life goals. Advisors can access the involvement groups and a library of career and interest assessments. They can recommend the right fit to students based on the student's profile, preferences, assessment insights, and so on.

Enhance the Efficiency of Academic Petitions and Waivers

Easily create and manage academic petitions and waivers with an intuitive form builder and configurable approval workflows. Centralizing tracking and outcome management reduces manual

errors and ensures a smoother process for administrators, students, and faculty or staff.

Explore Learning Programs and Request Details Directly in Campus and Program Finder

Make the request for learning program information intuitive. Create a card view for learning programs in Campus and Program Finder. Provide a button for applicants, students, and families to request more information about specific learning programs conveniently.

Support Applicants to Sign and Manage Their Application Submissions

Add control and flexibility to your dynamic admissions applications. Give applicants the option to digitally sign their applications when they're ready to submit. Offer the flexibility to cancel unsubmitted applications and withdraw submitted ones.

Use Tailored Gift Visualizations for Each Planned Gift Type

Access eight dynamic visualizations that automatically adapt to the structure of each planned gift type using Flexcards in the Gift Planning app. These Flexcards present the most important details at a glance, helping relationship officers quickly assess value, timelines, and stewardship needs. Select a gift type to get a layout that shows only the fields that matter, streamlining review and data entry.

Enhance Agentforce Education Feature Configuration and Setup

Discover and find configuration instructions for a broader range of Education features in Salesforce Go. Along with Recruitment and Admissions, you can now learn more about Alumni and Advancement, Student Success, and Academic Operations features, and get help with configuration by accessing content resources and links.

New and Changed Objects in Agentforce Education

Do more with the new and updated Education objects.

New Invocable Actions for Agentforce Education

Do more with the new invocable actions for Education.

New and Enhanced Common Features for Agentforce Education

Agentforce Education, formerly Education Cloud, includes access to some features that are available across clouds and products in Industries. Use these features to extend and customize Education Cloud based on your business needs.

- **Fundraising**

Give your staff and donors powerful tools for managing gifts. Donors can handle common requests, like changing recurring gifts, by using the self-service Donor Support Agent (Beta). Free up your staff by customizing the Gift Entry grid with templates and custom Lightning Web Components for faster processing. You can now add up to 50 designations to a single gift and backdate transactions for gift commitments, all from within the Gift Entry Grid. New object updates also help you track in-kind donations and add multiple designations. Streamline workflows, improve data accuracy, and provide Relationship Officers with clear, gift-specific views, with dynamic page layouts for gift planning.

Agentforce for Education

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline student financial management, offer autonomous transfer credit estimates, strengthen prospect research strategy, and centralize course collaboration within Slack.

Streamline Student Financials with Agentforce

Help students efficiently manage their accounts with the Student Financials Agent, which includes topics and actions that call on preconfigured flows and invocable actions. Students can chat with the agent to view their current balances, ask for fee breakdowns, and request more information about specific fees.

Provide Autonomous Transfer Credit Estimates to Prospective Students with Agentforce

Help prospective students with application decisions by making transfer credit estimates readily accessible in the Transfer Credit Agent (beta). Estimate credits that are transferable into an institution or learning programs right in an agent session to reduce response time for evaluations. Save previous estimates to give students continuous access.

Strengthen Prospect Strategy by Creating Slack Research Channels and Canvases with Agentforce

Integrate research workflows directly with Slack to accelerate decision making and improve collaboration across advancement teams. Give researchers and relationship officers a shared space to evaluate high-impact prospects. Researchers can build channels, publish canvases, and produce insights without leaving Slack. Relationship officers can join prospect-specific channels and review curated canvases.

Centralize Course Collaboration in Slack with Agentforce

Manage Course Operations workflows in Slack with Agentforce. Faculty can create channels for each course offering, maintain accurate participant lists, and publish a syllabus canvas in the same space where communication already happens. Real-time updates and easier access to course resources provide students with a unified academic experience.

Streamline Student Financials with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help students efficiently manage their accounts with the Student Financials Agent, which includes topics and actions that call on preconfigured flows and invocable actions. Students can chat with the agent to view their current balances, ask for fee breakdowns, and request more information about specific fees.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where the Education Cloud license and the applicable Agentforce add-on license are enabled.

Who: Users with the Education Cloud Full Access permission set can configure the Student Financials Agent. Additionally, logged in student users can use the Student Financials Agent.

How: In Setup, find and select **Set Up Education Cloud**. Enable **Turn On Student Financial Account Management Agent**.

Provide Autonomous Transfer Credit Estimates to Prospective Students with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help prospective students with application decisions by making transfer credit estimates readily accessible in the Transfer Credit Agent (beta). Estimate credits that are transferable into an institution or learning programs right in an agent session to reduce response time for evaluations. Save previous estimates to give students continuous access.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, Performance, and Developer editions where the Education Cloud license and the applicable Agentforce add-on licenses are enabled.

Note The Transfer Credit Agent is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer. Use of this pilot or beta service is at the Customer's sole discretion.

When: Transfer Credit Agent (beta) is available from Spring 2026.

Who: Users with the Education Cloud Full Access permission set can configure Transfer Credit Agent (beta). Any user, including guest users, can use Transfer Credit Agent (beta).

How: To turn on Transfer Credit Agent (beta), from Setup, find and select **Set Up Education Cloud**. Under Set Up Agentforce for Education Cloud, turn on **Student Recruitment Agent (Beta)**.

Make your purchase decisions only on the basis of generally available products and features.

Do more with the new invocable actions for Education.

Note Education Cloud is now Agentforce Education. You may see references to Education Cloud in our application and documentation.

Create an order and an associated academic order for a given learner and academic term

Use the new `createLearnerOrder` action.

Get the details of how a fee was calculated for a specified order item

Use the new `getFeeDetails` action.

Nonprofits

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about the latest features from Agentforce Nonprofit, formerly Nonprofit Cloud, that boost productivity throughout your organization. Support fundraising, programs, grantmaking, outcomes, and volunteers with the latest CRM capabilities.

Nonprofit Cloud is now Agentforce Nonprofit. You may continue to see the former name in our application and documentation.

- **Fundraising**

Give your staff and donors powerful tools for managing gifts. Donors can handle common requests, like changing recurring gifts, by using the self-service Donor Support Agent (Beta). Free up your staff by customizing the Gift Entry grid with templates and custom Lightning Web Components for faster processing. You can now add up to 50 designations to a single gift and backdate transactions for gift commitments, all from within the Gift Entry Grid. New object updates also help you track in-kind donations and add multiple designations. Streamline workflows, improve data accuracy, and provide relationship officers with clear, gift-specific views, by using dynamic Flexcards for gift planning.

- **Program and Case Management**

Manage the complete participant lifecycle with greater speed and accuracy. Allow potential participants to browse programs as guest users on your Experience Cloud site to increase engagement. When they apply, guide staff through a streamlined intake for one or many programs with real-time eligibility checks. Finally, capture service delivery faster with optimized mobile attendance tracking and accelerate your Data 360 readiness with updated data kits.

- **Grantmaking**

Adopt the Application Form object to future-proof your application process and ensure access to future platform enhancements. To improve completion rates, all form components are now mobile-friendly for a better user experience on any device. You can also require specific file attachments to prevent incomplete applications.

Get More from Agentforce Nonprofit with Expanded Object Capabilities

Your most-used Agentforce Nonprofit, formerly Nonprofit Cloud, objects now support standard Salesforce features, providing a more consistent and powerful user experience. Improve usability and operational efficiency by enabling path, kanban, and calendar for objects related to fundraising, program management, and volunteer management.

Volunteer Management

Find qualified volunteers for open job shifts quickly with a generative AI agent. This action matches volunteers based on their skills, location, and availability. To streamline your data integration, use the new data model objects (DMOs) for Volunteer Management Intelligence. These DMOs reduce setup complexity and eliminate the need for tedious, error-prone manual mapping to Data 360.

Get More from Agentforce Nonprofit with Expanded Object Capabilities

- FundraisingAccess
- Manage Volunteer Data
- Grantmaking Manager
- Outcome Management
- Education Cloud Full Access

Volunteer Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Find qualified volunteers for open job shifts quickly with a generative AI agent. This action matches volunteers based on their skills, location, and availability. To streamline your data integration, use the new data model objects (DMOs) for Volunteer Management Intelligence. These DMOs reduce setup complexity and eliminate the need for tedious, error-prone manual mapping to Data 360.

Analyze Volunteer Data in Data 360 with Data Model Objects for Volunteer Management

Combine the power of Data 360, formerly Data Cloud, with your Volunteer Management CRM data. Data model objects (DMOs) are now available in Data 360 for the entire Volunteer Management data model.

Manage Volunteer Shifts with the Shift Capacity and Coverage Agent

Easily identify shifts that need sign-ups and find the right volunteers to fill them by using the Find Unfilled Shifts and Match Volunteers to Shifts custom actions with the Shift Capacity and Coverage Agentforce topic. The Find Unfilled Shifts action searches for shifts by open capacity, time range, and optionally by Volunteer Initiative or Job Position. The Match Volunteers to Shifts action matches volunteers to the shifts by time, location, and qualification requirements.

Analyze Volunteer Data in Data 360 with Data Model Objects for Volunteer Management

Industries Common Features

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about enhancements to features used across Industries products, Revenue Management, and other apps.

Action Launcher

Extend action recommendations by using contextual information from service records to determine user intent.

Action Plans and Events and Milestones

Customize the quick actions on an action plan template record page. Include document checklist items in actions plans for financial accounts. Learn about the life events in a client's household at a glance.

Actionable Relationship Center

View many-to-one relationship type records on an Actionable Relationship Center (ARC) graph.

Batch Management

Use related object fields to control eligibility criteria and to group records for processing. Make the most of the new enhancements to fast-track batch job runs. All Spring '26 Batch Management changes are available for a limited set of process types, excluding the Flow process type.

Business Rules Engine

Experience improved scalability in decision tables with increased limits for invocations, output results, columns, and row processing. Expression sets enhancements include support for the IF function, automatic element naming, proactive alerts for constraint violations, and improved Salesforce Flow integration. Deploy rules to context definitions with improved stability. Monitor decision table actions in a centralized dashboard with real-time status and error details. Simplify the discovery and setup Business Rules Engine features with Salesforce Go. Clarify decisions with automated explanations for nested expression sets. Control how your expression set handles null values and no matches in decision tables based on your business requirements.

Collections and Recovery

Streamline debt recovery with outbound dialer campaigns.

Compliant Data Sharing

Compliant Data Sharing custom object record owners can now delete custom object participant records by using a new setting.

Criteria-Based Search and Filter

Use Criteria-Based Search and Filter to design a search experience for your users. You can configure a search based on a single object that unifies complex sets of data, such as inventory and aggregated customer information that's otherwise spread across multiple objects and fields. Criteria-Based Search and Filter can be customized to meet varied business requirements.

Context Service

Manage large context definitions with more ease by using the enhanced context definition mapping user interface with inline search and improved sort and filter abilities. Map extended context definitions to custom data spaces that contain preprocessed, harmonized, and unified data from multiple sources. Context Service now supports Second-Generation Managed Packaging (2GP). You can now package and deploy deactivated context definitions. Guided extensibility prevents mapping conflicts by enabling custom mappings only for allowed inherited nodes and attributes, ensuring stable upgrade experiences.

Data Processing Engine

Preview how your definitions transform data and instantly validate and debug definition design right for the builder. Create and run definitions in Data 360 companion orgs. Use a unified view to track the performance and key metrics of definitions. Get actionable recommendations for failed runs and download failed records to debug faster. Find and focus the Data Processing Engine canvas on nodes that you want to work on.

Discovery Framework

Easily present forms in the user's preferred language by storing assessment questions and responses in multiple languages. Save time by creating assessment questions with Generative AI so that you can generate, edit, and refine questions by using natural language instructions.

Engagement

Users access AI-driven insights on their home page with the Einstein Quick Insights component. The Salesforce Context Service provides more comprehensive, relevant insights by accessing a broader set of data. Additionally, users improve efficiency with Retained Output, which keeps the last run prompt and its output after a page refresh.

Fundraising

Give your staff and donors powerful tools for managing gifts. Donors can handle common requests, like changing recurring gifts, by using the self-service Donor Support Agent (beta). Free up your staff by customizing the Gift Entry Grid with templates and custom Lightning Web Components for faster processing. You can now add up to 50 designations to a single gift and backdate transactions for gift commitments, all from within the Gift Entry Grid. New object updates also help you track in-kind donations and add multiple designations. Streamline workflows, improve data accuracy, and provide Relationship Officers with clear, gift-specific views, with dynamic Flexcards for gift planning.

Grantmaking

Adopt the Application Form object to future-proof your application process and ensure access to future platform enhancements. To improve completion rates, all form components are now mobile-friendly for a better user experience on any device. You can also require specific file attachments to prevent incomplete applications.

Industries Configure, Price, Quote (CPQ)

Industries CPQ delivers unified order management and streamlines complex fulfillment by integrating with the Dynamic Revenue Orchestrator (DRO) for attribute-based decomposition. Boost cart

performance for large bundles with level-based loading and enhanced caching. Gain control over the Industries CPQ Cart with custom record types, pricing precision, and customizable fields. Ensure transactional accuracy by preserving original contract pricing, and correctly retaining asset status during attribute updates.

Interest Tags

Use sharing rules to extend sharing access to users for Tag Categories.

List Builder for Data Cloud Segment

Make Data Cloud actionable lists available in Data 360 companion orgs to help teams easily manage all customer interactions, from initial engagement to follow-up.

Omnistudio for Industries

Many Industries products include access to Omnistudio features. Use these features to extend and customize your product based on your business needs.

Process Compliance Navigator

Use Process Compliance Navigator to ensure your organization meets regulatory requirements, internal policies, and industry standards. Compliance governance is strengthened with new validation criteria enforcing auditable transitions for controls, regulations, and policies, ensuring consistent evidence. Efficiency is improved by using context definitions for streamlined data access in validation and Compliant Data Sharing for records.

Program and Case Management

Manage the complete participant lifecycle with greater speed and accuracy. Potential participants can now browse programs as guest users on your Experience Cloud site to increase engagement. When participants apply, guide staff through a streamlined intake for one or many programs with real-time eligibility checks. Finally, capture service delivery faster with optimized mobile attendance tracking and accelerate your Data 360 readiness with updated data kits.

Rollup Definitions

Configure multiple record rollup definitions within one LWC component for improved data visualization. Set up on-demand record rollup definitions quickly and efficiently using the guided setup. Help business executives make more informed decisions by using the enhancements to record rollup definitions.

Unified Catalog

Expedite fulfillment times for high-volume requests like password resets by using dedicated tracking and tailored workflows. Transfer complex Service Process packages, including all rules and flows, reliably between different orgs without manual fixes. Capture the most current and relevant inputs by directly updating service record attributes within the service design process. Control Service Process availability by using complex qualification logic that designers can easily build and deploy. Optimize your Service Process creation with improved attribute organization, support for more data types, and clearer display of record information. Equip service reps and internal request fulfillers to validate product eligibility for customers and employees by using the Check Product Eligibility Agentforce action.

Action Launcher

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Extend action recommendations by using contextual information from service records to determine user intent.

Recommend Actions Contextually on Any Record Page

Extend recommendations beyond voice and messaging sessions to Case, Incident, or Account records. Action Launcher automatically identifies the user's intent from contextual data like the case subject and description in your catalog app. Action Launcher then shows your contact center agents the relevant next action. Admins gain flexibility and control by configuring and deploying their own prompt templates to tailor how Action Launcher determines the best action by using generative AI.

Actionable Relationship Center

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

View many-to-one relationship type records on an Actionable Relationship Center (ARC) graph.

Visualize More Relationships on an ARC Graph

Show records related to each other via a many-to-one relationship type in ARC. The many-to-one relationship type uses a lookup relationship to link many records from an object to a single record from another object. In ARC, it shows a lookup field from the child node to the parent node. You can add one-to-many or many-to-many nodes to the child node. Previously, you could create an ARC graph by using only one-to-many or many-to-many relationship types.

Visualize More Relationships on an ARC Graph

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Previously, you could create an ARC graph by using only one-to-many or many-to-many relationship types.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions.

Why: See connections and related records in a household on an ARC graph by using the Party

Relationship Group object and many-to-one relationship type in ARC.

How: In Setup, create an ARC relationship graph. On the Properties tab, select relationship type as **Many-to-One**.

Batch Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use related object fields to control eligibility criteria and to group records for processing. Make the most of the new enhancements to fast-track batch job runs. All Spring '26 Batch Management changes are available for a limited set of process types, excluding the Flow process type.

Use Related Object Fields to Build Granular Record Controls

Optimize batch job filters with conditions that use related object fields to make sure jobs process only records relevant to the business process. A job that rejects presented quotes for lost opportunities on cold accounts can use filters on Opportunity and Account fields to include only relevant quotes.

Improve Batch Job Reliability by Grouping Related Records

Group records by using fields such as parent record ID to make batch jobs more reliable and prevent row lock errors. You can also group records by related object fields to make sure that the batch job processes records with common dependencies together. For example, you can group quotes by their related opportunity accounts to avoid conflicts during parallel processing.

Boost Batch Job Performance with the Latest Enhancements

Several enhancements make sure that batch jobs process records most efficiently and faster.

New Tooling API Objects in Batch Management

Use the new Tooling API objects in Batch Management to view the data sources and filter criteria of batch jobs.

Business Rules Engine

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Experience improved scalability in decision tables with increased limits for invocations, output results, columns, and row processing. Expression sets enhancements include support for the IF function, automatic element naming, proactive alerts for constraint violations, and improved Salesforce Flow integration. Deploy rules to context definitions with improved stability. Monitor decision table actions in a centralized dashboard with real-time status and error details. Simplify the discovery and setup Business Rules Engine features with Salesforce Go. Clarify decisions with automated explanations for nested expression sets. Control how your expression set handles null values and no matches in decision tables based on your business requirements.

Improve Scalability in Business Rules Engine

Experience minimized disruption, improved scalability and performance with improved limits on both standard and advanced decision tables. You can also invoke significantly more decision tables in your org per hour, allowing for more extensive and frequent processing.

Expression Set Enhancements

Business Rules Engine now supports the IF function, allowing for direct logical evaluations and fewer steps. Each element in the Expression Set builder now receives a distinct, automatically generated name, making it effortless to identify, manage, and debug rules. Receive proactive alerts notifying you if you add an element that exceeds system constraints, helping you avoid rework and ensuring your designs are always savable. Execute context-based Expression Sets from Salesforce Flow with more ease by using an enhanced invocable action that handles context hydration.

Improve Deployment Stability with Context Definitions

Experience greater stability during migrations and upgrades in your Business Rules Engine with rule definitions.

Monitor Decision Table Actions in a Centralized View

Monitor all your Decision Table actions in a dashboard that displays real-time status and error details. Easily filter and sort tables to prioritize attention, ensuring critical business logic is always current and reliable.

Simplify Business Rules Engine Feature Discovery and Setup

With Salesforce Go, you can discover and set up Business Rules Engine features, and track feature usage, all from a single location. Learn more about features and get help with configuration by accessing content resources and links. Explore more Business Rules Engine features from Salesforce Go.

Clarify Automated Decisions with Rule Explanations for Nested Expression Sets

Provide users with a deeper understanding of how automated decisions are reached within nested expression sets. This enhancement allows rule designers to offer more detailed, transparent explanations for every rule outcome, building trust and ensuring clarity in complex decision-making processes.

Control Null Values and No Matches in Expression Sets

Configure your expression sets to manage null values and decision table no-matches exactly as your business requires. This enhancement helps maintain the integrity of your calculations, reduces errors, and ensures that automated processes consistently deliver reliable results for better decision-making.

New and Changed Objects in Business Rules Engine

Do more with this new Business Rules Engine object.

Improve Scalability in Business Rules Engine

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Experience minimized disruption, improved scalability and performance with improved limits on both standard and advanced decision tables. You can also invoke significantly more decision tables in your org per hour, allowing for more extensive and frequent processing.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Business Rules Engine is enabled.

Why: These limits for standard decision tables have changed:

Default Limit	Old Value	New Value
Number of decision tables invoked per hour	450,000	2 million
Limit of output results that a standard decision table can have	5	10
For each combination of Equals, Required, and All conditions are met (AND) columns, the	10	15

Default Limit	Old Value	New Value
maximum number of columns in a standard decision table		
The limit of the number of groups that a standard decision table's rows can be split into	100	200
Limit of input columns that a standard decision table can have	30	100
Number of full refreshes that can be made per hour for all standard decision tables in an org	20	40

These limits for advanced decision tables have changed:

Default Limit	Old Value	New Value
The number of rows that an advanced decision table can process	2,000,000	20,000,000
The maximum number of rows in an advanced decision table for each combination of Equals, Required, and All conditions are met (AND) columns.	50	200
The number of advanced decision tables that can simultaneously be active in an org	60	100
Number of output columns in an advanced decision table	5	10
The number of output rows that can be returned when multiple sets of inputs are simultaneously looked up	4,000	40,000
The maximum number of advanced decision tables invoked per hour	1,440,000	10,800,000
Number of CSV files being	1	5

Default Limit	Old Value	New Value
uploaded simultaneously		
The number of rows that you can upload in a CSV-based decision table	10,000	50,000
Number of rows updated in an incremental refresh of an advanced decision table	100,000	1,000,000
Number of CSV files being downloaded simultaneously	2	5

These limits for expression sets have changed:

Default Limit	Old Value	New Value
The number of steps that a version can have	150	200
The number of local resources that can be used in a version	500	1000

Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Business Rules Engine now supports the IF function, allowing for direct logical evaluations and fewer steps. Each element in the Expression Set builder now receives a distinct, automatically generated name, making it effortless to identify, manage, and debug rules. Receive proactive alerts notifying you if you add an element that exceeds system constraints, helping you avoid rework and ensuring your designs are always savable. Execute context-based Expression Sets from Salesforce Flow with more ease by using an enhanced invocable action that handles context hydration.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Business Rules Engine is enabled.

Improve Deployment Stability with Context Definitions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Experience greater stability during migrations and upgrades in your Business Rules Engine with rule definitions.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Business Rules Engine and Context Service is enabled.

Who: To simulate rules, you need both the Rule Engine Designer and the Context Service Runtime permission sets.

Monitor Decision Table Actions in a Centralized View

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Monitor all your Decision Table actions in a dashboard that displays real-time status and error details. Easily filter and sort tables to prioritize attention, ensuring critical business logic is always current and reliable.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Business Rules Engine is enabled.

Simplify Business Rules Engine Feature Discovery and Setup

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Salesforce Go, you can discover and set up Business Rules Engine features, and track feature usage, all from a single location. Learn more about features and get help with configuration by accessing content resources and links. Explore more Business Rules Engine features from Salesforce Go.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Business Rules Engine is enabled.

Clarify Automated Decisions with Rule Explanations for Nested Expression Sets

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Provide users with a deeper understanding of how automated decisions are reached within nested expression sets. This enhancement allows rule designers to offer more detailed, transparent explanations for every rule outcome, building trust and ensuring clarity in complex decision-making processes.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Business Rules Engine is enabled.

Collections and Recovery

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline debt recovery with outbound dialer campaigns.

[Automate Outreach to Delinquent Borrowers to Boost Cash Flow and Reduce Bad Debt](#)

Drive successful repayment outcomes with informed and personalized communication. Use Service Cloud Voice with Amazon Connect to schedule an outbound dialer campaign. Create a targeted list of collection plans and schedule a collection campaign to dial borrowers automatically when a

collections specialist is available. Specialists instantly receive the collection plan context and can track all resulting calling activity centrally on the root collection record.

New Invocable Actions

Use the new invocable actions in Salesforce flows for Collections Outbound Dialer.

Automate Outreach to Delinquent Borrowers to Boost Cash Flow and Reduce Bad Debt

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Drive successful repayment outcomes with informed and personalized communication. Use Service Cloud Voice with Amazon Connect to schedule an outbound dialer campaign. Create a targeted list of collection plans and schedule a collection campaign to dial borrowers automatically when a collections specialist is available. Specialists instantly receive the collection plan context and can track all resulting calling activity centrally on the root collection record.

Where: This change applies to Lightning Experience with the Collections and Recovery add on and Service Cloud Voice add on.

Who: Users with administrative access to their Amazon web services account and Amazon Connect instance can configure Amazon Connect. Users with administrative access to their Salesforce org can configure Service Cloud Voice.

How: Configure Amazon Connect to integrate with Salesforce. Clone and customize the prebuilt flows to schedule collection campaigns and initiate outbound calls.

New Invocable Actions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Compliant Data Sharing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Compliant Data Sharing custom object record owners can now delete custom object participant records by using a new setting.

Delete Compliant Data Sharing Participant Records

For Compliant Data Sharing custom objects, record owners have more control to manage participant records. Users without delete access to the Compliant Data Sharing parent custom object can delete a participant record if they own the parent record.

Delete Compliant Data Sharing Participant Records

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

For Compliant Data Sharing custom objects, record owners have more control to manage participant records. Users without delete access to the Compliant Data Sharing parent custom object can delete a participant record if they own the parent record.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions.

How: From Setup, select the Delete custom object participant record by parent record owner setting.

Criteria-Based Search and Filter

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Criteria-Based Search and Filter to design a search experience for your users. You can configure a search based on a single object that unifies complex sets of data, such as inventory and aggregated customer information that's otherwise spread across multiple objects and fields. Criteria-Based Search and Filter can be customized to meet varied business requirements.

Optimize Search Experience with Consistent Data Display

Criteria-Based Search and Filter (CBSF) now provides a more intuitive and reliable search experience with consistent data display and clear visibility into when data was last updated. Date-time fields appear in the user's timezone using standard Salesforce formatting, and currency fields display symbols instead of codes. Any Word Search is enabled by default in all orgs, and users can view the Last Refreshed Date for search results, enhancing clarity and efficiency.

Optimize Search Experience with Consistent Data Display

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Criteria-Based Search and Filter (CBSF) now provides a more intuitive and reliable search experience with consistent data display and clear visibility into when data was last updated. Date-time fields appear in the user's timezone using standard Salesforce formatting, and currency fields display symbols instead of codes. Any Word Search is enabled by default in all orgs, and users can view the Last Refreshed Date for search results, enhancing clarity and efficiency.

Where: This change applies to Lightning Experience editions of Automotive Cloud, Health Cloud, Manufacturing Cloud, Nonprofit Cloud, and Public Sector Solutions where Criteria-Based Search and Filter is enabled.

Who: This feature is available to users with the Criteria-Based Search and Filter system permission.

How: These changes are automatically applied to the CBSF user interface, including the use of local timezone formatting for date-time fields (e.g., 10/25/2024, 2:36 PM) and currency symbols (e.g., \$)

instead of currency codes.

For administrators, to enable the Last Refreshed Date display, link the searchable object configuration to the Data Processing Engine (DPE) that populates the flat entity data. The date will then appear at the top of the search results.

Context Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage large context definitions with more ease by using the enhanced context definition mapping user interface with inline search and improved sort and filter abilities. Map extended context definitions to custom data spaces that contain preprocessed, harmonized, and unified data from multiple sources. Context Service now supports Second-Generation Managed Packaging (2GP). You can now package and deploy deactivated context definitions. Guided extensibility prevents mapping conflicts by enabling custom mappings only for allowed inherited nodes and attributes, ensuring stable upgrade experiences.

Enhanced Context Definition Mapping User Interface

Streamline your context definition mapping experience with a redesigned user interface allowing for more efficient management of large context definitions. Speed up your configuration process by managing Input and sObject mappings from a single interface. Map attributes and fields faster with inline search, and enhanced sort and filter capabilities.

Select Data Space for a Context Mapping

Use the power of Data 360 for your extended context definition by changing a mapping to a custom data space. Reduce the possibilities of mapping errors by selecting a data space that contains preprocessed, harmonized, and unified data from multiple sources for all data model objects (DMOs).

Context Definition Packaging and Migration Enhancements

Package and deploy deactivated context definitions. Context definitions also now support Second-Generation Managed Packaging (2GP).

Enhance Mapping Integrity with Guided Extensibility

Prevent mapping conflicts by enabling custom mappings only for specific inherited nodes and attributes, ensuring stable and predictable upgrade experiences in the future.

Enhanced Context Definition Mapping User Interface

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline your context definition mapping experience with a redesigned user interface allowing for more efficient management of large context definitions. Speed up your configuration process by managing Input and sObject mappings from a single interface. Map attributes and fields faster with inline search, and enhanced sort and filter capabilities.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and Developer editions where Context Service is enabled.

How: To add a context mapping, go to Context Definition in Setup. From the Custom Definitions tab, select a context definition. From the Map Data tab, click **Add Mapping**. Add a name and description for your mapping, select a Mapping Intent value, and then click **Map**.

Prevent mapping conflicts by enabling custom mappings only for specific inherited nodes and attributes, ensuring stable and predictable upgrade experiences in the future.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and Developer editions where Context Service is enabled.

Data Processing Engine

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Preview how your definitions transform data and instantly validate and debug definition design right for the builder. Create and run definitions in Data 360 companion orgs. Use a unified view to track the performance and key metrics of definitions. Get actionable recommendations for failed runs and download failed records to debug faster. Find and focus the Data Processing Engine canvas on nodes that you want to work on.

[Validate Logic and Debug Faster with Data Preview](#)

Validate your definition design instantly during creation. Generate data previews to verify that your

configuration meets business needs and to identify logic errors. Use input variables to simulate different runtime conditions and apply data source filters to isolate specific datasets. Easily search the results to check whether definitions are working as expected. Intuitively correlate the results with node configurations and visualize how data flows across nodes.

Run Definitions in Data 360 Companion Orgs

Enhance your multi-org setup by creating definitions in companion orgs to transform data from data model objects (DMOs), data lake objects (DLOs), and calculated insights. You can decouple central business processes orchestrated in the home org from local processes managed in companion orgs.

Get Holistic Insights About Definition Performance in a Single View

Get comprehensive observations about the performance of definitions and their runs on the Analysis tab. Use the tab's insights to stay informed about duration and data processing volumes for the latest and previous runs. Make informed decisions about your org's Data Pipeline usage requirements by tracking the execution and writeback utilization numbers. Easily find the reasons and the remedies for failed runs.

Get Actionable Guidance for Failed Runs

Monitoring Workflow Services now provides more contextual messages that identify the root causes of run failure. The messages come with actionable solutions that empower you to fix issues related to definition design, access controls, and runtime platform setup or performance. You also get to know about the exact stage during the execution process when the run failed.

Retrieve Details of Records that Failed Writeback

Download the details of the records that definitions failed to write back. You can individually download the failed records for each Writeback Object node with failed records. Use the failed record details to diagnose issues in the definition or the records that caused the write back to fail.

Monitor Record Group Counts for Composite Writeback

Monitor Workflow Services shows the aggregated count of input, output, and failed record groups for Composite Writeback nodes. Record group counts from child tasks roll up to the node's parent task. Unlike tasks for other nodes, Composite Writeback tasks track record groups generated by the node's grouping logic.

Locate Nodes You're Looking for with Ease

Use advanced search in the Data Processing Engine builder to jump to the node you want to review or reconfigure. When you select a node from the search results, the canvas automatically centers on the selected node and its neighbors.

Data 360 Enhancements in Data Processing Engine

Enhance the transformation logic of definitions with new functions and learn about the count of records processed by nodes.

Changed Objects in Monitor Workflow Services for Data Processing Engine

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reduce the manual effort of creating assessment questions by using the power of Generative AI. Use natural language instructions and AI to generate assessment questions for a form. Edit and refine the generated questions directly in the assessment form to make sure they fit your business needs.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Discovery Framework.

Note This feature uses [Einstein Generative AI](#) and may consume Einstein Requests. [Einstein Generative AI Features](#) are provided on a separate infrastructure with different security protections and physical hosting locations than the Services. See [Salesforce Trust and Compliance Documentation](#).

How: From the Assessment Questions list view, click **Draft Questions with Agentforce**.

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Users access AI-driven insights on their home page with the Einstein Quick Insights component. The Salesforce Context Service provides more comprehensive, relevant insights by accessing a broader set of data. Additionally, users improve efficiency with Retained Output, which keeps the last run prompt and its output after a page refresh.

Enhance AI Summaries with Multimodal Inputs

Customize your embedded AI experience by using flex prompt templates that take multiple inputs. Create prompts grounded in multiple objects, text, or files, including PDFs, images, and text documents, directly on the component's UI. Generate more powerful, multimodal insights, eliminating inefficient manual workflows and increasing the accuracy of AI-generated summaries.

Optimize Sorting and Filtering of Prompt Data with Context Service

Improve the reliability of AI-generated summary ranking and prioritization. Use Context Service design time filters to ensure consistent results for your context-driven prompts. Get reliable results by removing the need for the Large Language Model (LLM) to handle sorting and filtering.

Enhance AI Summaries with Multimodal Inputs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Customize your embedded AI experience by using flex prompt templates that take multiple inputs. Create prompts grounded in multiple objects, text, or files, including PDFs, images, and text documents, directly on the component's UI. Generate more powerful, multimodal insights, eliminating inefficient manual workflows and increasing the accuracy of AI-generated summaries.

Where: This change applies to Lightning Experience in Starter, Professional, Enterprise, Unlimited, and Developer editions with Einstein Summary.

Who: To use this feature, you need the Einstein for Service Innovations, Einstein GPT Platform, Einstein GPT Prompt Builder, and Einstein GPT Field Generation add-on licenses.

Optimize Sorting and Filtering of Prompt Data with Context Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Improve the reliability of AI-generated summary ranking and prioritization. Use Context Service design time filters to ensure consistent results for your context-driven prompts. Get reliable results by removing the need for the Large Language Model (LLM) to handle sorting and filtering.

Where: This change applies to Lightning Experience in Starter, Professional, Enterprise, Unlimited, and Developer editions where Context Service is enabled.

Who: To use this feature, users need the Context Service Admin permission set or the Context Service Runtime User permission set.

How: In Setup open a prompt template in Prompt Builder and select Resource. From Resources, select **Context Service**, **Configure Context Service**, and then click **Default Context Data Provider**. Enter the context definition details and the filter API name.

Fundraising

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your staff and donors powerful tools for managing gifts. Donors can handle common requests, like changing recurring gifts, by using the self-service Donor Support Agent (beta). Free up your staff by customizing the Gift Entry Grid with templates and custom Lightning Web Components for faster processing. You can now add up to 50 designations to a single gift and backdate transactions for gift commitments, all from within the Gift Entry Grid. New object updates also help you track in-kind donations and add multiple designations. Streamline workflows, improve data accuracy, and provide Relationship Officers with clear, gift-specific views, with dynamic Flexcards for gift planning.

[Improve the Donor Experience with a Self-Service Donor Support Agent \(Beta\)](#)

Give your donors the power to instantly manage their own recurring gifts by using an Experience Cloud site. The Donor Support Agent (beta) helps donors to handle common requests like changing a recurring gift's amount and frequency. Free up your staff's time to focus on building relationships while

providing donors with the fast, modern experience that they expect.

Tailor the Gift Entry Experience

Customize the Gift Entry Grid to match your unique fundraising processes. Admins can create and manage multiple templates, select an active gift entry template on Gift Batch, add or remove columns, and integrate custom Lightning components for tasks like payment processing. Build a targeted and efficient experience that helps your users capture the right gift data quickly and accurately.

Streamline Gift Entry with Flexible Tools

Improve your gift processing efficiency with key updates to Fundraising objects. Gift entry now supports \$0 gift transactions, so that you can track non-monetary gifts and in-kind donations. You can also add up to 50 designations to a single gift and backdate transactions for gift commitments, all from within the Gift Entry Grid.

Use Tailored Gift Visualizations for Each Planned Gift Type

Access eight dynamic visualizations that automatically adapt to the structure of each planned gift type using Flexcards in the Gift Planning app. These Flexcards present the most important details at a glance, helping relationship officers quickly assess value, timelines, and stewardship needs. Select a gift type to get a layout that shows only the fields that matter, streamlining review and data entry.

Strengthen Prospect Strategy by Creating Slack Research Channels and Canvases with Agentforce

Integrate research workflows directly with Slack to accelerate decision making and improve collaboration across advancement teams. Give researchers and relationship officers a shared space to evaluate high-impact prospects. Researchers can build channels, publish canvases, and produce insights without leaving Slack. Relationship officers can join prospect-specific channels and review curated canvases.

New and Changed Objects for Fundraising

Do more with the new and updated Fundraising objects.

Improve the Donor Experience with a Self-Service Donor Support Agent (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Give your donors the power to instantly manage their own recurring gifts by using an Experience Cloud site. The Donor Support Agent (beta) helps donors to handle common requests like changing a recurring gift's amount and frequency. Free up your staff's time to focus on building relationships while providing donors with the fast, modern experience that they expect.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions where Fundraising is enabled.

Note Donor Support Agent is a pilot or beta service that is subject to the Beta Services Terms at

[Agreements – Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Who:

- Admins with the FundraisingAccess and the Agentforce Default Admin permission sets can set up the agent.
- Users with the Fundraising Experience Cloud permission set and Manage Donations with Agentforce in Experience Cloud (beta) permission sets can use the agent in an Experience Cloud site.
- Admins of Fundraising with Agentforce Education, formerly Education Cloud, turn on Fundraising in Agentforce Education and then create and assign a permission set to their users.

How: In Settings, turn on **Agentforce Employee Agents** and **Donor Support Agent (beta)**. In Agentforce Studio, turn on **Agentforce Agents**.

Do more with the new and updated Fundraising objects.

Note If you're an existing customer and you don't see the new or changed fields, then ask your Salesforce admin to add the fields in the page layout of the respective objects.

Store the template data for Gift Entry Grid templates

Use the new GiftEntryGridTemplate object.

Store the designation information for the gift

Use the new **GiftDesignationInformation** field on the GiftBatch object.

Represent the junction between a Donor Gift Concept and an Opportunity

Use the new DonorGiftConceptOpportunity object.

Grantmaking

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Adopt the Application Form object to future-proof your application process and ensure access to future platform enhancements. To improve completion rates, all form components are now mobile-friendly for a better user experience on any device. You can also require specific file attachments to prevent incomplete applications.

Future-Proof Your Application Process with the Application Form Object

Configure your grant application intake process by using the Application Form object, the standard for applications across Agentforce Nonprofit, formerly Nonprofit Cloud, and Industries. The Application Form and related objects support key features such as compliant data sharing, stage management, and form framework. Adopting this standard makes sure that you can leverage future platform enhancements as they're released.

Complete Forms with a Mobile-Friendly Design and Simplified File Management

Streamline the application process for your users with two major enhancements to Form Framework. All form components, including Overview, Section, and Review, are now fully responsive and mobile-friendly for a better user experience on any device. Management of attachments in forms is simplified with a new component in flows and Flexcards.

Do more with the new and updated Grantmaking objects.

Note If you're an existing customer and you don't see the new or changed fields, then ask your Salesforce admin to add the fields in the page layout of the respective objects.

Set and store the details of an application form evaluation

Use the new `ApplicationFormEvaluation` object.

Set and store the details of an application form evaluation section

Use the new `ApplicationFormEvalSection` object.

Store pertinent information and associations for the application

Use the new **Title**, **Purpose**, **RequestedAmount**, **ApplicationStatus**, **ReferenceRecord**, **Contact**, **Budget**, and **UsageType** fields on the `ApplicationForm` object.

Identify the application form that relates to the funding award

Use the new **ApplicationForm** field on the `FundingAward` object.

Industries Configure, Price, Quote (CPQ)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Industries CPQ delivers unified order management and streamlines complex fulfillment by integrating with the Dynamic Revenue Orchestrator (DRO) for attribute-based decomposition. Boost cart performance for large bundles with level-based loading and enhanced caching. Gain control over the Industries CPQ Cart with custom record types, pricing precision, and customizable fields. Ensure transactional accuracy by preserving original contract pricing, and correctly retaining asset status during attribute updates.

Optimize Invocable Actions User Access with New Permission Set

Simplify permission management by granting precise access to the prebuilt invocable actions in the Communication, Media, and Energy & Utilities managed package. To ensure that your users maintain access to the necessary invocable actions, migrate from the managed package licenses to the

permission set licenses, and use the CME Agentforce permission set.

Integrate DRO with Industries CPQ

Enable streamlined order operations by connecting Industries CPQ with Dynamic Revenue Orchestrator (DRO) within a unified platform. This integration supports existing Enterprise Product Catalog (EPC) structures, without the need for commercial and technical catalog migration. The DRO system facilitates fulfillment by decomposing complex products into technical products based on attribute rules, product hierarchies, custom order fields, and defined decomposition relationships. Use the DRO Decomposition and Fulfillment workspace to streamline your entire order lifecycle by creating detailed, end-to-end orchestration plans. Gain full control over complex scenarios as DRO efficiently processes advanced orders like Change of Plan, In-flight Amendments, and sub-actions. DRO comprises features such as order management console, fallout, and jeopardy management and order priorities.

Optimize Performance for Complex Carts with Level-Based Pagination for Standard Cart APIs

Provide an improved user experience for your Industries CPQ Cart with large product bundles with deep hierarchies. Achieve reduced loading time and Apex Governor limit by implementing a level-based approach to loading the cart content. You can load the top-level items first, followed by their first-level children.

Enhance Asset to Order Conversion with New Record Type Field

Customize orders by defining your preferred record type value in the API payload. Include the RecordTypeId in the InputField parameter when converting an asset to order under the Standard Cart API's assetToOrder action.

Streamline Cart Operations and Data Updates with Advanced Caching

Provide an effortless user experience in the Industries CPQ cart operations. Guarantee uninterrupted availability for critical pricing updates and configuration data. This capability extends even to massive datasets with the high-performance Enhanced Caching Mode.

Get Pricing Benefits by Retaining Original Asset Price in Standard Cart APIs

Provide an elevated user experience by retaining the original contract price. Retain the pricing discounts and minimize billing disputes even when updating the nonimpacting pricing attributes for the user. Manage all the subscriptions and assets while preserving their pricing advantage.

Gain More Control Over Your Industries CPQ Cart with New Line Item Fields

Elevate your experience with a more relevant Industries CPQ Cart view. With the new Type and Formatter fields, you can personalize the cart as per your preference.

Get Accurate Line Item Pricing Values with Improved Decimal Precision

Achieve data clarity and consistency with precise line item values up to five decimal points. You can set the preferred precision to control the number of decimal digits appearing in the pricing line item of the Enhanced LWC Cart.

Achieve Transactional Integrity with a Single Click

Provide a unified experience to global customers, preserving transactional accuracy in your Industries CPQ cart. Prevent potential billing errors for your customers by displaying the order and pricelist currency, regardless of their currency setting.

Prevent Unnecessary Action Status Updates During MACD Operations

Preserve the Existing status on asset line items when Move, Add, Change, Delete (MACD) rules update attribute properties without altering the actual values. Industries CPQ compares original and current

values to ensure only actual data modifications trigger a Change status. This logic prevents unnecessary processing errors in downstream Order Management systems.

Optimize Invocable Actions User Access with New Permission Set

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Elevate your experience with a more relevant Industries CPQ Cart view. With the new Type and Formatter fields, you can personalize the cart as per your preference.

Where: This change applies to Lightning Experience in all editions with the Communications, Media, and Energy & Utilities managed package.

Who: This feature is available to users who have the Industries CPQ license with the Enhanced LWC Cart. Also, the necessary permissions to configure and use Standard Cart APIs.

Get Accurate Line Item Pricing Values with Improved Decimal Precision

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Achieve data clarity and consistency with precise line item values up to five decimal points. You can set the preferred precision to control the number of decimal digits appearing in the pricing line item of the Enhanced LWC Cart.

Where: This change applies to Lightning Experience in all editions with the Communications, Media, and Energy & Utilities managed package.

Who: This feature is available to users with the Industries CPQ license and the necessary permissions to configure and use Standard Cart APIs.

Achieve Transactional Integrity with a Single Click

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Provide a unified experience to global customers, preserving transactional accuracy in your Industries CPQ cart. Prevent potential billing errors for your customers by displaying the order and pricelist currency, regardless of their currency setting.

Where: This change applies to Lightning Experience in all editions with Communications, Media, and Energy & Utilities managed package.

Who: This feature is available to users with the Industries CPQ license and the latest version of the CME package. The primary beneficiaries are sales representatives who create quotes for global customers with different price lists.

How: From the App Launcher, find and select **Company Information** and enable **Activate Multiple Currencies**.

Prevent Unnecessary Action Status Updates During MACD Operations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Preserve the Existing status on asset line items when Move, Add, Change, Delete (MACD) rules update attribute properties without altering the actual values. Industries CPQ compares original and current values to ensure only actual data modifications trigger a Change status. This logic prevents unnecessary processing errors in downstream Order Management systems.

Where: This change applies to Classic and Lightning Experience in all editions with Communications, Media, Energy & Utilities managed package.

Who: This feature is available to users with the Industries CPQ license and the necessary permissions to configure and use Standard Cart APIs.

Why: Previously, both value modifications and metadata changes triggered a status update to Change. Distinguishing modification types ensures that the Line Item Action Status remains Existing for behavior

changes, offering a clearer view of actual asset modifications.

How: From the CPQ Configuration Setup, enable the **MACDLineItemActionStatus** setting.

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use sharing rules to extend sharing access to users for Tag Categories.

Enforce Sharing Rules for Tag Category

Prevent users from seeing tag categories that belong to work groups outside of their work group by using sharing rules. When the default internal access for tag categories is set to private, create sharing rules to grant users or groups access to tag categories.

Enforce Sharing Rules for Tag Category

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Prevent users from seeing tag categories that belong to work groups outside of their work group by using sharing rules. When the default internal access for tag categories is set to private, create sharing rules to grant users or groups access to tag categories.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions.

How: In Setup, find and select **Sharing Settings**. When the default internal access sharing setting for Tag Category is set to private, create sharing rules to grant access to users and groups based on your business needs.

List Builder for Data Cloud Segment

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make Data Cloud actionable lists available in Data 360 companion orgs to help teams easily manage all customer interactions, from initial engagement to follow-up.

Extend Actionable Lists to Your Companion Orgs

Your teams in Data 360 companion orgs can now leverage the same relevant actionable lists that were previously available only in the home org. Engage with prospects and customers seamlessly, documenting responses, completing transactions, and scheduling follow-ups, no matter which org you're in.

Extend Actionable Lists to Your Companion Orgs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Your teams in Data 360 companion orgs can now leverage the same relevant actionable lists that were previously available only in the home org. Engage with prospects and customers seamlessly, documenting responses, completing transactions, and scheduling follow-ups, no matter which org you're in.

Where: This change applies to Lightning Experience in Starter, Enterprise, Professional, and Unlimited editions with Industries Service Excellence and a Data Processing Engine platform license. This feature requires Data Cloud One, Data Spaces, Segmentation and Activation, Sonic Embedded Store Base, and Customer Data Platform add-on licenses.

Omnistudio for Industries

Process Compliance Navigator

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Process Compliance Navigator to ensure your organization meets regulatory requirements, internal policies, and industry standards. Compliance governance is strengthened with new validation criteria enforcing auditable transitions for controls, regulations, and policies, ensuring consistent evidence. Efficiency is improved by using context definitions for streamlined data access in validation and Compliant Data Sharing for records.

Control Compliance Record Access by Using Compliant Data Sharing

Record owners in organizations with strict sharing policies can now grant other users access to their records by using Compliant Data Sharing for Process Compliance Navigator. Define record sharing rules for your compliance users so that record owners can share business operations processes, compliance policies, compliance regulations, compliance controls, and validation procedures with participant groups and participant roles.

Achieve Audit Readiness with Compliance Control Testing

Verify that your compliance controls are successfully mitigating risks and enforcing regulations and policies with compliance testing. This testing evaluates a control's operating effectiveness, confirms its design function, and captures verifiable evidence during the execution of the test. Use these details to demonstrate to regulators and auditors that your compliance program works as intended.

Enforce Compliance Control Testing Status Transition and Validation Criteria

Strengthen your compliance framework and create an audit trail with the new Compliance Control Testing Status Transition and Validation Criteria setting. This setting enhances data governance by enforcing mandatory validation and transition rules whenever a user modifies the status of a Compliance Control Version Test Execution record. By locking down key attributes and transitions, this setting prevents the creation of inconsistent or unverifiable test evidence. For example, when the setting is turned on, enforce a rule that if the execution status is completed, a user can't update it to a different value.

Streamline Data Access with Context Definitions

Define business context in your validation procedures with context definitions. A context definition acts as a structured data layer and translator that organizes data so that you can easily map and access relevant information across multiple objects. For example, to enforce compliance and prevent customer harassment, debt collection agencies must follow regulations that limit the number of times that they can call a customer. By using a context definition, you can now validate contact data, such as call frequency and time zone fields, before an agent initiates a call. The validation procedure passes in

contact record data to validate it for compliance, ensuring agents adhere to all call limitations.

Clarify Purpose with the Renamed Logged-in User Locale Setting

To ensure clarity and better reflect its purpose, the User Locale setting is now named Logged-in User Locale. This setting uses the logged-in user's locale when logging API messages for Business Rules Engine compliance controls. Previously, this setting was called User Locale.

Enforce Validation Criteria for Regulations and Policies

Maintain an auditable and compliant lifecycle for managing your organization's regulations and internal policies by using the Regulation and Policy Status Transition and Validation Criteria setting. Acting as a governance gatekeeper for compliance officers, the setting enforces criteria before updating regulation version or compliance policy version.

Track Policies and Regulations that Govern Your Assets

Improve the traceability of your regulated hardware and software assets by mapping regulation clause versions, compliance policy clause versions, and compliance control versions to an asset. Use this structure to maintain a record of the policies and regulations governing your assets, visualize control relationships, report on coverage gaps, and demonstrate adequate control implementation for compliance.

New Agentforce Process Compliance Navigator Jumpstart Bundles

Quickly get started with Agentforce Process Compliance Navigator by using preconfigured features and flows designed to reduce setup time and complexity.

New Objects in Process Compliance Navigator

Do more with these new and updated Process Compliance Navigator objects.

Control Compliance Record Access by Using Compliant Data Sharing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Record owners in organizations with strict sharing policies can now grant other users access to their records by using Compliant Data Sharing for Process Compliance Navigator. Define record sharing rules for your compliance users so that record owners can share business operations processes, compliance policies, compliance regulations, compliance controls, and validation procedures with participant groups and participant roles.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

Who: To set up this feature, users need the Compliance Admin permission set and the Configure Compliant Data Sharing system permission. To share records by using Compliant Data Sharing, users need the Compliance User permission set and the Use Compliant Data Sharing system permission, and edit access on the record they're sharing. To have a record shared with them using Compliant Data

Sharing, users need the Compliance User permission set and the Use Compliant Data Sharing system permission.

How: Create and assign Compliant Data Sharing permission sets. From Setup, turn on Compliant Data Sharing for compliance objects, and then create participant groups and participant roles.

Achieve Audit Readiness with Compliance Control Testing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Verify that your compliance controls are successfully mitigating risks and enforcing regulations and policies with compliance testing. This testing evaluates a control's operating effectiveness, confirms its design function, and captures verifiable evidence during the execution of the test. Use these details to demonstrate to regulators and auditors that your compliance program works as intended.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

How: Create a compliance test record designed to validate compliance with regulatory requirements. After you confirm that compliance is effective, then create a compliance control version test execution record to track the details captured during the execution of a compliance control test.

Enforce Compliance Control Testing Status Transition and Validation Criteria

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Strengthen your compliance framework and create an audit trail with the new Compliance Control Testing Status Transition and Validation Criteria setting. This setting enhances data governance by enforcing mandatory validation and transition rules whenever a user modifies the status of a Compliance Control Version Test Execution record. By locking down key attributes and transitions, this setting prevents the creation of inconsistent or unverifiable test evidence. For example, when the setting is

turned on, enforce a rule that if the execution status is completed, a user can't update it to a different value.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

How: From Setup, select **Compliance**, and then select **Compliance Control Testing Status Transition and Validation Criteria**.

Streamline Data Access with Context Definitions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Define business context in your validation procedures with context definitions. A context definition acts as a structured data layer and translator that organizes data so that you can easily map and access relevant information across multiple objects. For example, to enforce compliance and prevent customer harassment, debt collection agencies must follow regulations that limit the number of times that they can call a customer. By using a context definition, you can now validate contact data, such as call frequency and time zone fields, before an agent initiates a call. The validation procedure passes in contact record data to validate it for compliance, ensuring agents adhere to all call limitations.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

How: Create a context definition by choosing nodes, defining their relationship, adding attributes, and applying context tags. Add the context definition context ID to the validation procedure.

Clarify Purpose with the Renamed Logged-in User Locale Setting

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To ensure clarity and better reflect its purpose, the User Locale setting is now named Logged-in User Locale. This setting uses the logged-in user's locale when logging API messages for Business Rules Engine compliance controls. Previously, this setting was called User Locale.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

How: From Setup, select **Compliance**, and then select **Logged-in User Locale**.

Enforce Validation Criteria for Regulations and Policies

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Maintain an auditable and compliant lifecycle for managing your organization's regulations and internal policies by using the Regulation and Policy Status Transition and Validation Criteria setting. Acting as a governance gatekeeper for compliance officers, the setting enforces criteria before updating regulation version or compliance policy version.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

Why: This setting prevents premature activation or incorrect retirement of rules so that your organization always operates on the legally effective version of a regulation or policy. For example, you can publish a regulation version only when all of the associated regulation clause versions are published or active. Previously, users could update the status field on the regulation version or compliance policy version without enforced transition and validation criteria.

How: From Setup, select **Compliance**, and then select **Regulation and Policy Status Transition and Validation Criteria**.

Track Policies and Regulations that Govern Your Assets

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve the traceability of your regulated hardware and software assets by mapping regulation clause versions, compliance policy clause versions, and compliance control versions to an asset. Use this structure to maintain a record of the policies and regulations governing your assets, visualize control relationships, report on coverage gaps, and demonstrate adequate control implementation for

compliance.

Where: This change applies to Lightning Experience in Developer, Enterprise, and Unlimited editions with Process Compliance Navigator.

How: On a regulation clause version, compliance policy clause version, or compliance control version record page, add an asset to the Asset related list.

New Agentforce Process Compliance Navigator Jumpstart Bundles

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly get started with Agentforce Process Compliance Navigator by using preconfigured features and flows designed to reduce setup time and complexity.

To establish the core platform components for Compliance Collections Jumpstart, install this prerequisite bundle

Use the new **Compliance Collections Jumpstart Foundation** bundle in Salesforce Go.

Enforce FDCPA and CFPB compliance for loan collections through automated call timing and frequency controls. Install Compliance Collections Foundation first, as it provides the prerequisite components

Use the new **Compliance Collections Jumpstart** bundle in Salesforce Go.

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Do more with these new and updated Process Compliance Navigator objects.

Represent the association between an Asset and a Regulation Clause Version

Use the new AssetRegClauseVersion object.

Represent the association between an Asset and a Compliance Policy Clause Version

Use the new AssetCmplPolicyCVer object.

Represent the association between an Asset and a Compliance Control Version

Use the new AssetCmplControlVersion object.

Represent the Compliant Data Sharing participant user or group with whom a business operations process is shared

Use the new BusOperProcParticipant object.

Represent the Compliant Data Sharing participant user or group with whom a compliance control is shared

Use the new CmplControlParticipant object.

Represent the Compliant Data Sharing participant user or group with whom a compliance policy is shared

Use the new CmplPolicyParticipant object.

Represent the Compliant Data Sharing participant user or group with whom a validation procedure is shared

Use the new CmplVldProcdParticipant object.

Represent the Compliant Data Sharing participant user or group with whom a regulation is shared

Use the new RegulationParticipant object.

Represent the association between a Compliance Control Version and Compliance Control Test

Use the new CmplControlVersionTest object.

Represents a test designed to validate compliance with regulatory requirements

Use the new ComplianceTest object.

Represents the details captured during the execution of a compliance control test

Use the new CmplCtrlVerTestExecution object.

Indicate whether the record was generated using AI

Use the new IsAiGenerated field on the BusOperProcRegCVer, RegCICmplControlVer, and RegCICmplPlcyCVer objects.

Program and Case Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage the complete participant lifecycle with greater speed and accuracy. Potential participants can now browse programs as guest users on your Experience Cloud site to increase engagement. When participants apply, guide staff through a streamlined intake for one or many programs with real-time eligibility checks. Finally, capture service delivery faster with optimized mobile attendance tracking and accelerate your Data 360 readiness with updated data kits.

Lower the Barrier to Entry with Guest Access for Program Management

Potential participants can now browse your programs and benefits on an Experience Cloud site without creating an account. Guest users can explore your offerings to determine if a program is a good match. When they're ready, they can easily submit a referral to begin the intake process, which reduces friction and increases engagement with your nonprofit.

Simplify On-The-Go Attendance Tracking for Your Staff

Taking attendance for benefit sessions is now faster and easier for staff working in the field. The attendance experience is optimized in the Salesforce mobile app to facilitate quick data capture. Staff can use their phones or tablets to find sessions or participants, update single or multiple participant records at once, and save their work with confidence. Capturing data in real time reduces administrative work and improves accuracy, so that your team spends less time on data entry and more time on your mission.

Streamline Participant Intake with a Guided Work Flow

The new Intake app guides intake coordinators through a more efficient enrollment process with the Create Application flow to create new intakes quickly. When enrolling a participant in multiple programs, form sections are now deduplicated, so your users only enter overlapping information once. Separately, the Complete Application flow automates the creation of enrollment records and cases, which provides a smooth hand-off to case managers.

Confirm Participant Program Eligibility in Real Time

Save staff time, reduce manual errors, and improve the participant application experience by checking participant eligibility for programs instantly. Create robust eligibility criteria that are unique to each program, and check a participant's eligibility against their participant record on an application with the Business Rules Engine. Intake coordinators can see a participant's status, which helps them make faster decisions and prevent non-compliant enrollments.

Accelerate Data 360 Readiness for Program and Case Management

Easily bring the latest objects and fields into Data 360, formerly Data Cloud, with updates to the existing Program and Case Management data model objects (DMOs). Attributes for Attendance were added to the Benefit Session and Program Enrollment DMOs as well as additional attributes for Benefit

Type and Referral DMOs.

New and Updated Objects in Program and Case Management

Do more with the new and updated Program and Case Management objects.

Lower the Barrier to Entry with Guest Access for Program Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Potential participants can now browse your programs and benefits on an Experience Cloud site without creating an account. Guest users can explore your offerings to determine if a program is a good match. When they're ready, they can easily submit a referral to begin the intake process, which reduces friction and increases engagement with your nonprofit.

Where: This change applies to Lightning Experience and the Salesforce mobile app for iOS and Android in all editions, except Database.com, where Program Management is enabled.

Who: Unauthenticated users with these permissions can browse programs and benefits on an Experience Cloud site.

- Apply the Program Management Guest Access permission set to the Guest User profile.
- Share Program, Benefit Type, and Referral objects with the Guest User profile.

Simplify On-The-Go Attendance Tracking for Your Staff

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Taking attendance for benefit sessions is now faster and easier for staff working in the field. The attendance experience is optimized in the Salesforce mobile app to facilitate quick data capture. Staff can use their phones or tablets to find sessions or participants, update single or multiple participant records at once, and save their work with confidence. Capturing data in real time reduces administrative work and improves accuracy, so that your team spends less time on data entry and more time on your mission.

Where: This change applies to Lightning Experience in Professional, Enterprise, Unlimited, and

Developer editions where Program Management is enabled.

Who: Users with the Program and Case Management for Experience Cloud permission set, or the Advanced Program Management permission set, can take on-the-go attendance.

Streamline Participant Intake with a Guided Work Flow

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Do more with the new and updated Program and Case Management objects.

Note If you're an existing customer and you don't see the new or changed fields, then ask your Salesforce admin to add the fields in the page layout of the respective objects.

Log the criteria that defines a participant's enrollment eligibility for one or more programs

Use the new `EnrollmentEligibilityCriteria` object.

Set eligibility criteria and recommendations for a program

Use the new `ProgramRecommendationRule` object.

Set eligibility criteria by using expression sets that relate directly to the program

Use the new `ProgramEnrlEligibilityCrit` object.

Note the date when the enrollee's program eligibility status was last verified

Use the new **EligibilityLastVerifiedDate** field on the `ProgramEnrollment` object.

Create a hierarchy of action plan templates to use when applying for multiple programs at once

Use the new **ParentTemplate** field on the `ActionPlanTemplate` object.

Rollup Definitions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Configure multiple record rollup definitions within one LWC component for improved data visualization. Set up on-demand record rollup definitions quickly and efficiently using the guided setup. Help business executives make more informed decisions by using the enhancements to record rollup definitions.

Make More Informed Decisions with On-Demand Record Rollup

Save time and improve efficiency for your business executives by enabling them to refresh record rollup results instantly. Help them make better decisions by making sure that the data they're working with is always up-to-date and accurate. Business executives can get the latest rollup results without waiting for scheduled refresh cycles. Enable or disable On-Demand Record Rollup as needed based on your business requirements.

View Multiple Record Rollup Results in One Place

Save time and effort by configuring multiple record rollup definitions in the new LWC component. Business executives can give more personalized advice to clients by viewing multiple rollup results, such as the assets, financial accounts, and policies associated with a household on the household record page. If on-demand record rollup is enabled for a record rollup definition, your business executives can instantly update the rollup results, enabling them to make informed decisions based on the up-to-date rollup results.

Configure On-Demand Record Rollup Easily with the New Guided Setup

Complete the tasks required to set up and configure on-demand record rollup for rollup definitions by

using the On-Demand Record Rollup guided setup.

Expedite fulfillment times for high-volume requests like password resets by using dedicated tracking and tailored workflows. Transfer complex Service Process packages, including all rules and flows, reliably between different orgs without manual fixes. Capture the most current and relevant inputs by directly updating service record attributes within the service design process. Control Service Process availability by using complex qualification logic that designers can easily build and deploy. Optimize your Service Process creation with improved attribute organization, support for more data types, and clearer display of record information. Equip service reps and internal request fulfillers to validate product eligibility for customers and employees by using the Check Product Eligibility Agentforce action.

Build Tailored Workflows for Standardized Service Requests

Reduce turnaround times for transactional service requests like new software installations and hardware upgrade requests. Use service requests to manage and track all your high-volume, one-time fulfillment tasks. Anchor your request workflows on the Service Request object with specialized Service Level Agreements (SLAs) to give request fulfillers dedicated insight into fulfillment metrics and the request backlog. Provide request-specific tasks to expedite processing. Empower requestors to self-serve their needs with workflows designed for requests that don't require manual intervention.

Enhance Service Process Portability by Using Guided Template Deployment

Export and import a complete service process package—including intake forms, flows, eligibility rules, and agent actions—across Salesforce orgs. The deployment wizard guides you through the necessary configurations, which ensures reliability and eliminates manual post-deployment tasks. Use the out-of-the-box templates to recreate service processes that were previously defined in the Service Catalog app. Unified Catalog doesn't support the migration of those specific Service Catalog-created processes.

Control Service Object Updates Directly in Service Design

Service designers can now directly create, view, and select attributes from the service object, then add them as Service Process Attributes. This process eliminates the need to rely on system admins for context definition and mapping. You can specify default values or make these fields available for user entry, ensuring your primary record captures the relevant, up-to-date inputs.

Design Flexible Eligibility Rules with Granular Logic Control

Empower your designers to create and manage eligibility rules without technical help, speeding up decision-making and providing only relevant service processes. The intuitive, modular UI guides you through defining complex qualification and disqualification logic across all your service offerings. Designers can now implement flexible conditions at the rule level, giving you control over the logic, freeing you from the limitations of a rigid structure.

Verify Product Eligibility on Behalf of Customers and Employees

Empower service reps and internal request fulfillers to check whether customers and employees are eligible for a product. Add the Check Product Eligibility Agentforce action to assisted service processes to accelerate fulfillment by offloading entitlement validations to AI agents.

Other Enhancements to Unified Catalog

Learn about the other attributes enhancements that optimize the service process creation experience in Unified Catalog.

Build Tailored Workflows for Standardized Service Requests

Other Enhancements to Unified Catalog

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about the other attributes enhancements that optimize the service process creation experience in Unified Catalog.

Where: This change applies to Lightning Experience in Professional, Enterprise, and Unlimited editions with Unified Catalog.

Why: Unified Catalog offers these new enhancements for attributes.

- **Enhanced Organization:** You can now categorize attributes in separate sections and easily move them across these sections.
- **Additional Data Types:** More data types are now supported, including Lookup, List of Attachments, Email, Multi-Select Values, Time, Range, Radio Button, URL, and Telephone. These types streamline the service process designer's ability to configure and build comprehensive catalogs.
- **Enhanced Context Information:** The Attribute Settings page presents detailed context attribute information, making configuration and management clearer.
- **Enhanced Display in Case Details:** Requestors can view lookup attributes with the record name in case details, providing better visual accessibility, as compared to the previous format that showed IDs.

Personalize every moment of engagement across the customer lifecycle and drive growth for your business with the latest features and enhancements from Salesforce Marketing apps.

Marketing Cloud Next

Marketing Cloud Next (also known as Agentforce Marketing) offers many updates for Growth and Advanced editions in Spring '26. Changes include support for business units, Agentforce enhancements for campaigns, reusable content blocks, new metrics and conversion analytics, and other enhancements across messaging channels.

Marketing Cloud Account Engagement

Drive alignment across teams and close deals faster with Marketing Cloud Account Engagement for B2B marketers. Expand your communication channels by sending approved email, SMS, and WhatsApp content, and visualize engagement data in new Tableau Next dashboards. Connect your business units to Data 360 and Marketing Cloud Next with a streamlined setup and enhanced email consent management. Plus, explore improved security for Google Group sends.

Marketing Cloud Engagement

Marketing Cloud Engagement delivers personalized customer journeys across marketing, advertising, commerce, and service. The Spring '26 Marketing Cloud Engagement release occurs January 16, 2026 through February 20, 2026.

Marketing Intelligence in Marketing Cloud Next

Marketing Intelligence in Marketing Cloud Next delivers more control, flexibility, and insight in Spring '26. Expand your data model, unify more sources with new API connectors, gain deeper visibility with enhanced dashboard views, and optimize campaigns with improved objective-based insights.

Salesforce Personalization in Marketing Cloud Next

Drive real-time personalization decisions in mobile experiences using the Personalization module in Data 360 Engagement Mobile SDK. Dynamically adapt your website's content, imagery, and tone in real-time based on user behavior signals.

Loyalty Management in Marketing Cloud Next

Improve member benefits by enabling partner linkage and creating digital passes. Standardize the points expiration process and boost performance with asynchronous processing of high volumes of data. Target your audience better using unified individuals and set up data graphs in companion orgs.

Referral Marketing

Connect outbound engagements with business units in Marketing Cloud Next. Use unified segments to enhance audience targeting and companion org data graphs to improve data accuracy.

Marketing Cloud Next

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Marketing Cloud Next (also known as Agentforce Marketing) offers many updates for Growth and Advanced editions in Spring '26. Changes include support for business units, Agentforce enhancements for campaigns, reusable content blocks, new metrics and conversion analytics, and other enhancements across messaging channels.

Create Grounded, Interactive Campaigns with the Agentforce Campaign Experience

Marketers can create campaigns even faster with enhancements that add grounding, branding, content refinement, and previews to the conversation experience. They can also turn one-way email broadcasts into dynamic, two-way interactions.

Partition and Align Data and Marketing Content with Business Units

Marketing Cloud Next (also known as Agentforce Marketing) now supports business units so that you can align your marketing operations with your organizational structure. To partition and secure data and content, match each business unit to a division, brand, or region. Teams can stay focused on their goals, while leadership enjoys enterprise-wide visibility. To ensure data separation, map each business unit to a unique data space.

Create and Personalize Content More Efficiently

Create any type of marketing content faster with productivity enhancements including extensions, preconfigured templates, and reusable content blocks. Build richer, more personalized emails, and get more control over email templates and template sharing. Personalize landing pages and forms with dynamic content and progressive profiling, and create branded preference pages.

Reach Your Customers with Messaging Channels

Enhance your marketing reach with messaging channels featuring capabilities such as targeted in-app messages, two-way emails, UTM links for tracking SMS campaigns, and interactive WhatsApp templates.

Drive Better Outcomes with Improved Reporting Tools

Enhance your campaign reach and engagement with improved dashboards for mobile app performance and message deliverability. Use the new Conversion Analytics dashboard to measure attribution and outcomes.

Other Changes in Marketing Cloud Next

Learn about other changes we made in Spring '26.

Updates to Related Features

Looking for other features in Marketing Cloud Next? Check out these related updates for Account Engagement, Engagement, and Intelligence.

Create Grounded, Interactive Campaigns with the Agentforce Campaign Experience

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Marketers can create campaigns even faster with enhancements that add grounding, branding, content refinement, and previews to the conversation experience. They can also turn one-way email broadcasts into dynamic, two-way interactions.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next Growth or Advanced editions and Marketing Cloud Next for Marketing Cloud Engagement and the Agentforce Employee Agent add-on. They also apply to these editions when Salesforce Foundations is enabled. Your edition determines the options that you have.

Draft and Preview Briefs and Campaigns in an Agentforce Conversation

With the campaign experience in an Agentforce conversation, marketers can preview campaigns directly in the brief, and they can return to the brief at any time to refine structure and content before final campaign generation. To support these changes, we've added the Refine Campaign Preview agent topic and action and updated the Save Campaign and Generate Campaign from Brief flows and the Draft Campaign from Brief Prompt template. Related flows also now include improved error handling and campaign preview steps.

The campaign brief with campaign preview appears next the Agentforce chat panel, including a preview of multi-channel steps in the campaign flow, such as email and SMS messages.

How: To get started, from Agentforce Builder, deploy the Campaign Creation agent. If you've already deployed the Campaign Creation agent, topics, or actions in Agent Builder, redeploy them to get the latest changes. Review any customizations that you made to the agent in case you want to make similar changes to the latest version.

SEE ALSO | *Salesforce Help:* [Agentforce in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

Engage Customers with Two-Way, Conversational Email

Turn one-way email broadcasts into dynamic, two-way interactions. Conversational Email and SMS engages customers through responsive, threaded conversations that are powered by Agentforce agents. Capture high-intent replies, resolve customer queries, and deliver personalized support, without leaving the Salesforce platform. Flow Builder enhancements, including Wait Until Response, and conversation forwarding enable customers to convert any existing one-way campaigns to two-way campaigns.

How: Use Campaign Agent to easily create two-way conversational campaigns. Provide a user utterance or select an option in the campaign brief, and Campaign Agent generates a preview of a standard two-way email and SMS campaign. It automatically includes the flow elements needed to support two-way conversations with the Default Agent.

Draft Marketing Briefs Based on Existing Strategic Documents

To ground a campaign brief in existing content, upload documents, such as PDFs or Word files, into Salesforce Files and mention them in your prompt. The agent automatically processes the file grounding, generates the brief, and adds a link to the source documents in the new brief record.

SEE ALSO | *Salesforce Help*: [Agentforce in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help*: [Upload Files](#) (can be outdated or unavailable during release preview)

Generate Briefs and Campaign Previews Grounded in the Related Brand

When Agentforce drafts a campaign preview, it now uses the tone and identity of the brand that's related to the brief. Get more relevant campaign drafts that require fewer manual edits.

Add Campaign Context with Brief Grounding

Add essential context with additional fields to ground your campaign. A custom agent can include primary campaign goal and KPI, priority, calls to action, and guardrails. These additional grounding fields ensure the agent provides targeted and strategic decisions to reduce generic responses.

Partition and Align Data and Marketing Content with Business Units

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Marketing Cloud Next (also known as Agentforce Marketing) now supports business units so that you can align your marketing operations with your organizational structure. To partition and secure data and content, match each business unit to a division, brand, or region. Teams can stay focused on their goals, while leadership enjoys enterprise-wide visibility. To ensure data separation, map each business unit to a unique data space.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Advanced edition.

Why: Business units allow you to maintain compliance, align messaging with audiences, and measure your marketing performance. Business units support these capabilities.

- Create up to 50 business units per org.

- Assign users to one or more business units.
- Align a business unit's data with its respective data space by adding filters on marketing DLOs automatically.
- Assign campaigns and marketing workspaces to a business unit.
- Assign channels (Email, SMS, WhatsApp, and Mobile App Messaging) and subscriptions to a single or all business units.
- View marketing performance for a business unit or create a business unit to capture performance at the enterprise level.
- Track visitor activities for your campaign on external web pages at a business-unit level.
- Use business unit-scoped Einstein features, including Send Time Optimization, Engagement Frequency, and Engagement Scoring and tell Agentforce which business unit to operate for the Campaign Creation Agent.
- To set the scope for subsequent actions when creating campaigns in the current Agentforce session, use the new Identify Business Unit agent action to determine user access to a business unit. To get the latest updates for business unit support, redeploy your campaign creation agent, topics, or actions.
- Monitor setup progress for all of your business units on the Assistant Home in Setup. A progress summary highlights required tasks for each business unit, and a graphic shows a status overview of all business units.

How: After you enable business units in Setup, complete the steps to create your first two business units. Any existing marketing configuration, including data space and default content workspace, are used to create the first business unit.

SEE ALSO | *Salesforce Help*: [Get Started With Business Units](#) (can be outdated or unavailable during release preview)

Create and Personalize Content More Efficiently

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create any type of marketing content faster with productivity enhancements including extensions, preconfigured templates, and reusable content blocks. Build richer, more personalized emails, and get more control over email templates and template sharing. Personalize landing pages and forms with dynamic content and progressive profiling, and create branded preference pages.

Create Content Faster with Productivity Enhancements

Create content faster with extensions and enhancements to content templates and reusable content blocks. Use extensions to add productivity features to the content authoring experience such as third-party generative AI tools. Quickly create consistent content by using preconfigured email and landing page templates and reusable content blocks, which are now available to landing pages. More new

features in emails, landing pages, and forms streamline the content creation and personalization processes.

Build Richer, More Personalized Emails and Share Consistent Templates

Marketers can build richer emails with the rich text editing toolbar in paragraph components and by attaching PDFs. Advanced data sources available in emails offer more personalization options. Pro-code email authors can create more sophisticated and deeply personalized messages with Handlebars scripting. To better control and enforce email layouts, marketing managers can lock and unlock elements of email templates. Then, to increase productivity without sacrificing consistency, marketers can share approved email templates outside of their marketing teams.

Brand and Personalize Web Content

Personalize landing pages with dynamic content and streamline forms with progressive profiling rules. To give subscribers a consistent experience throughout your campaign, design custom preference pages that reflect your brand.

Create Content Faster with Productivity Enhancements

This release is in preview

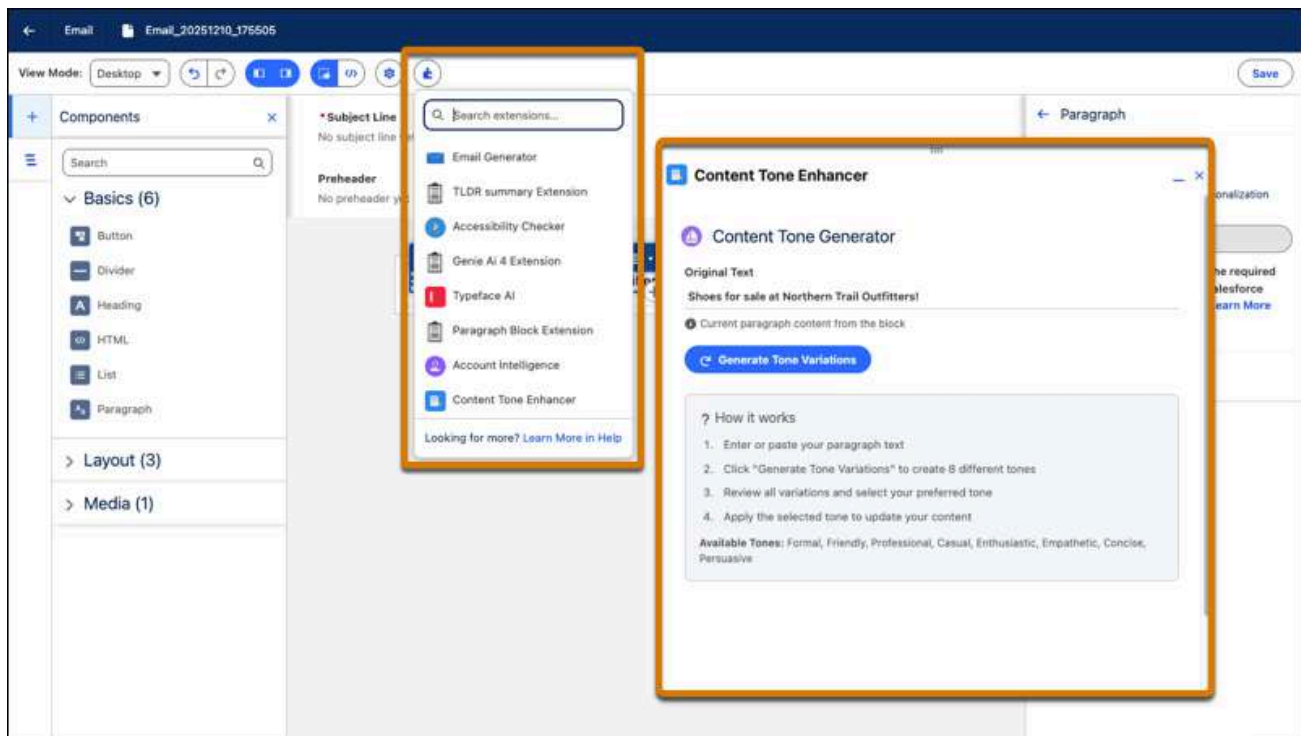

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create content faster with extensions and enhancements to content templates and reusable content blocks. Use extensions to add productivity features to the content authoring experience such as third-party generative AI tools. Quickly create consistent content by using preconfigured email and landing page templates and reusable content blocks, which are now available to landing pages. More new features in emails, landing pages, and forms streamline the content creation and personalization processes.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next Growth or Advanced editions, and Marketing Cloud Next for Marketing Cloud Engagement. They also apply to these editions when Salesforce Foundations is enabled. Your edition determines the options that you have.

Improve Readability with Extensions

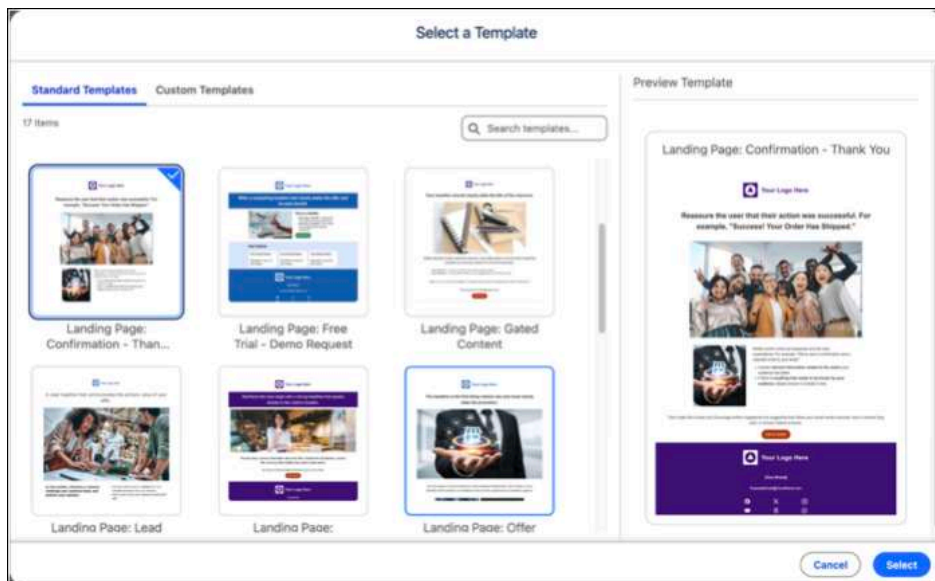

Add productivity features, such as third-party generative AI tools, tone and grammar editors, and translators, to the content authoring experience with extensions. Extensions appear in a floating panel in the builder and marketers can use them to draft, revise, or customize the entire content body or individual components. Developers can build extensions for specific content types or for builder components.

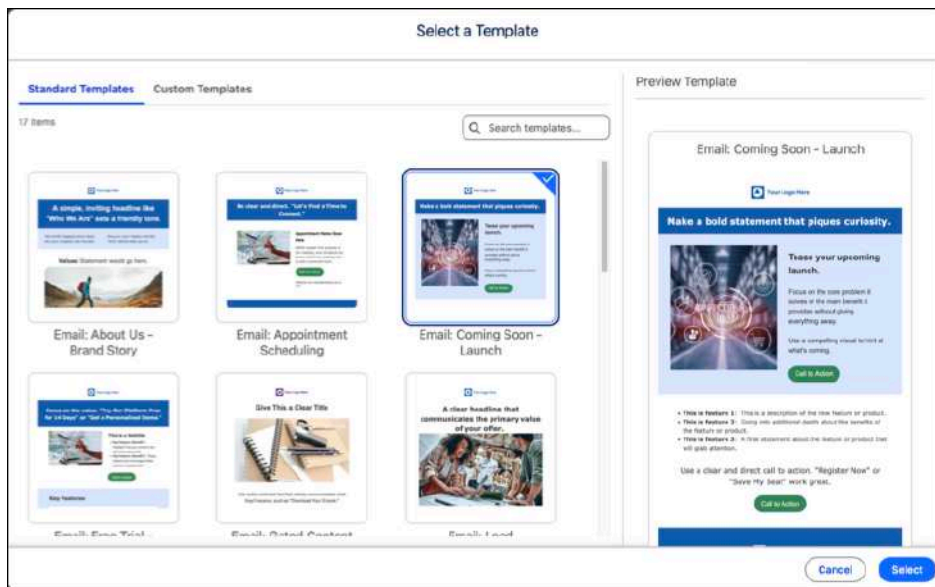

SEE ALSO | [Create Content More Efficiently by Using Improved Extensions in Salesforce CMS](#)

Tailored Templates for Quick and Easy Branding

Access a library of preconfigured email and landing page templates that are designed to be applicable to every industry. Marketers can now quickly customize and style the content with ease to align with your campaign goals and branding.

SEE ALSO | [Salesforce Help: Create an Email Template in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

SEE ALSO | [Share Marketing-Approved Email Templates with Non-Marketing Users](#) (can be outdated or unavailable during release preview)

Reuse and Customize Content Blocks in Landing Pages and Emails

To make sure that landing pages are consistent, content admins or managers can create reusable blocks of content such as banners, footers, or other standard layouts. Use the new Content Block: Landing Page to combine text, images, and buttons into a reusable block that marketers can add to landing pages. To streamline authoring, content blocks are customizable in landing pages and emails. Marketers can convert a content block to a section, and then edit it without impacting the original reusable block.

SEE ALSO | [Salesforce Help: Create and Manage a Reusable Content Block](#) (can be outdated or unavailable during release preview)

Build Richer, More Personalized Emails and Share Consistent Templates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Marketers can build richer emails with the rich text editing toolbar in paragraph components and by attaching PDFs. Advanced data sources available in emails offer more personalization options. Pro-code email authors can create more sophisticated and deeply personalized messages with Handlebars

scripting. To better control and enforce email layouts, marketing managers can lock and unlock elements of email templates. Then, to increase productivity without sacrificing consistency, marketers can share approved email templates outside of their marketing teams.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with access to Marketing Cloud Next Growth or Advanced editions. They also apply when Salesforce Foundations is enabled. Your edition determines the options that you have.

Share Marketing-Approved Email Templates with Non-Marketing Users

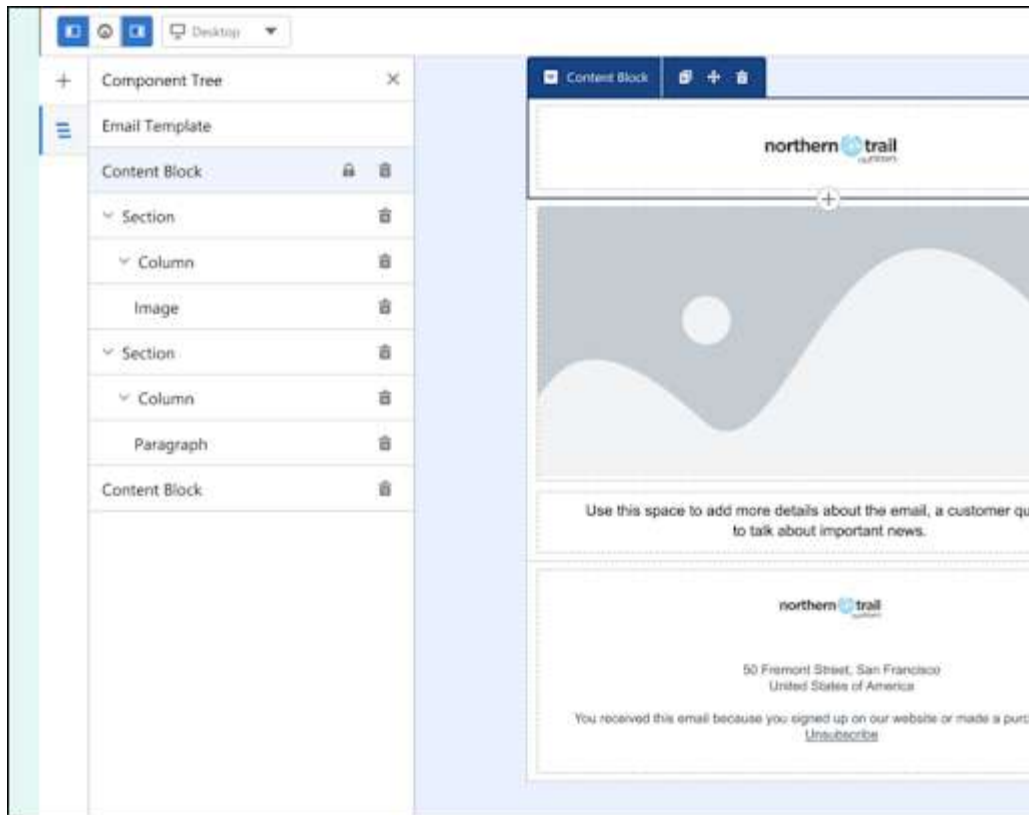

To increase productivity without sacrificing brand consistency, marketers can now share approved email templates built in Marketing Cloud Next with sales reps and other users. After a marketer creates an email template, they can add it to a flow and lock or unlock specific components. Publishing the flow makes the email template available in an easy email composer that's ready to use. An admin must turn on Distributed Marketing and Alerts in Setup, and adds the required Lightning components to record pages.

SEE ALSO | *Salesforce Help*: [Distributed Marketing and Alerts Overview](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help*: [Set Up Distributed Marketing and Alerts](#) (can be outdated or unavailable during release preview)

Enforce Brand Standards with Email Template Locks

Marketing managers can now ensure brand consistency by locking specific elements on an email template. Protect critical content—such as subject lines, headers, and legal disclaimers—and prevent accidental changes by authors. While fixed elements remain secure, authors retain the flexibility to customize unlocked areas. Visual indicators in the component tree clearly show which sections are non-editable.

SEE ALSO | *Salesforce Help*: [Create an Email Template in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

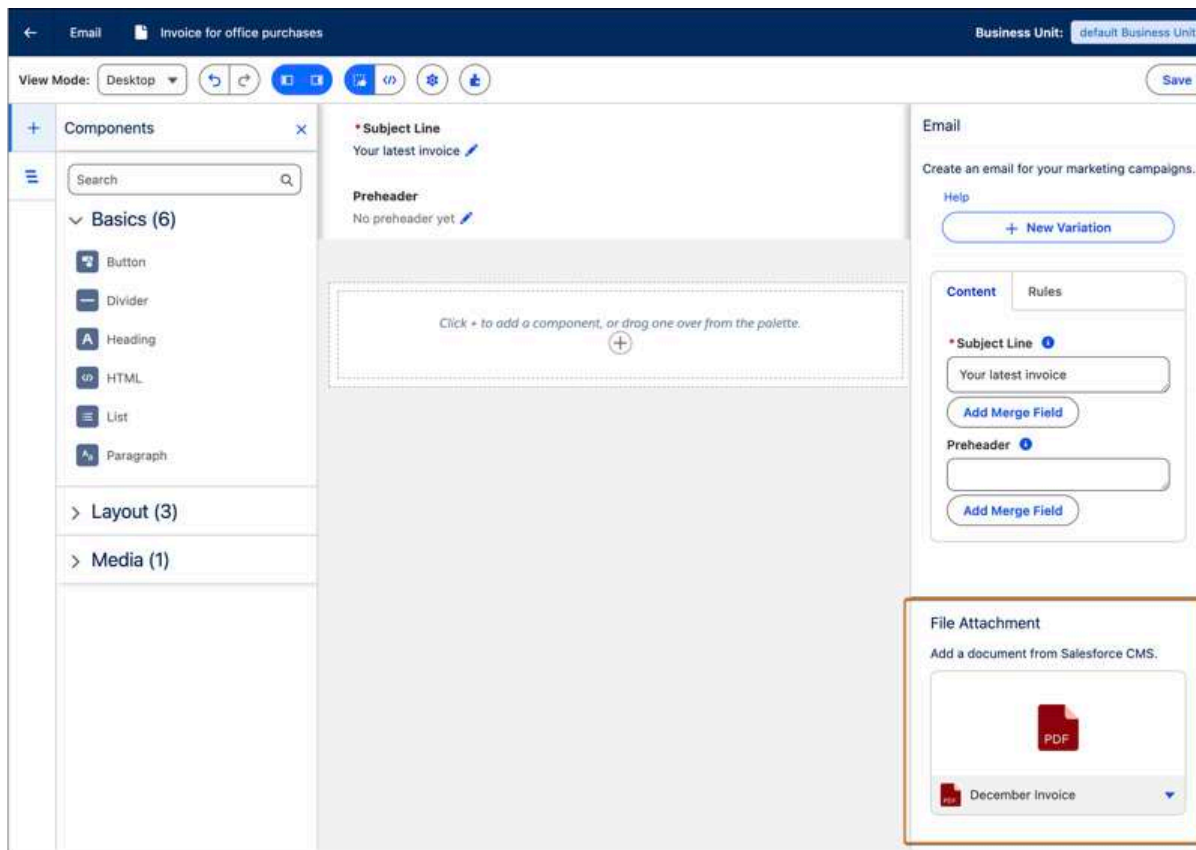

Personalize Email Messages with Advanced Data Sources

Get more flexibility in personalizing email content with expanded data source support for segment data, Apex classes, and lookup data graphs. Reference Data 360 segment data for data-driven email targeting. Use Apex Classes to pass complex, structured data, such as entire order collections, directly from Flow to your messages, and then build fast, highly personalized transactional messages like order confirmations using that data. Define specialized lookup data graphs that use non-profile data from Data 360, such as product catalogs, to complement the default data graph or unified individual.

SEE ALSO | *Salesforce Help*: [Manage Data Sources for Personalization](#) (can be outdated or unavailable during release preview)

Attach PDF Documents to Marketing Cloud Next Emails

Marketers can now include important business documents such as terms of service, whitepapers, or invoices in emails. In the Property panel, select a PDF from Salesforce CMS that's 5 MB or less, and attach it to your email.

SEE ALSO | [Salesforce Help: Create CMS Content](#) (can be outdated or unavailable during release preview)

SEE ALSO | [Salesforce Help: Create an Email in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

Get Greater Control Over Email Content with Low-Code Scripting

For sophisticated content personalization and detailed control over message content, use the industry-standard Handlebars templating language. Designer-developers and advanced marketers can access this low-code scripting language from Code View while they build emails. Convert existing emails to code and then write, view, and edit scripts that add conditional logic or perform lookups for relevant data. As you author, the code view provides syntax validation, inline coding assistance, and search.

SEE ALSO | [Salesforce Help: Create an Email in Code View in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

SEE ALSO | [Marketing Cloud Next Developer Guide: Create an Email in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

Style Email Content by Using the Enhanced Rich Text Editor

We added more granular control over text styling and spacing for email layouts. Enhancements include emojis, font families, sizes, and line heights; text and background colors; block quotes and horizontal

lines.

Brand and Personalize Web Content

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Personalize landing pages with dynamic content and streamline forms with progressive profiling rules. To give subscribers a consistent experience throughout your campaign, design custom preference pages that reflect your brand.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next Growth or Advanced editions, and Marketing Cloud Next for Marketing Cloud Engagement. They also apply to these editions when Salesforce Foundations is enabled. Your edition determines the options that you have.

Personalize Marketing Landing Pages by Using Dynamic Content

To personalize a landing page for different audiences, marketers can now create dynamic variations of components, such as headers, sections, and images. To control when a page visitor sees a personalized variation, set rules that identify the target audience. With enhancements to the preview experience, marketers can select a segment and a sample visitor to test variations. To personalize emails and landing pages consistently within a campaign, marketers reuse the same personalization settings by cloning a personalization point.

SEE ALSO | *Salesforce Help:* [How Dynamic Content and Personalization Work Together](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help:* [Create and Manage Dynamic Content Variations](#) (can be outdated or unavailable during release preview)

Enable Dynamic Data Collection for Forms

Accelerate the form submission process and capture more leads when you apply progressive profiling rules to forms. After someone responds to an item, they're prompted to provide other details over time. Progressive profiling curates the user experience, asking for details such as job title or phone number only after capturing their email address or name in previous interactions. Form creators must add a data graph or data source to a form, and then configure profiling rules for each field on the Properties panel.

SEE ALSO | *Salesforce Help:* [Manage Progressive Profiling Rules on Forms](#) (can be outdated or unavailable during release preview)

Customize Preference Pages to Reflect Your Brand

Give your subscribers a consistent and trustworthy experience by designing branded custom preference pages. Enable the Customizable Preference Page feature to create distinct pages tailored to different channels. To ensure subscribers always view a branded page, you can also set a default specific page for your communications.

SEE ALSO | *Salesforce Help*: [Create Customizable Preference Pages](#) (can be outdated or unavailable during release preview)

Reach Your Customers with Messaging Channels

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance your marketing reach with messaging channels featuring capabilities such as targeted in-app messages, two-way emails, UTM links for tracking SMS campaigns, and interactive WhatsApp templates.

Engage Mobile App Customers and Track Their Interactions

Boost mobile app marketing and engagement with targeted in-app messages and near real-time flash notifications. Gain insights into customer behavior by tracking custom events like clicks, screen views, and purchases.

Enhance SMS Tracking with UTM Links

Now, create and use UTM links to track the performance of your SMS campaigns and identify which SMS messages drive the most traffic and conversions. Build personalized URLs with standard UTM and custom parameters while creating your SMS messages. This new enhancement reduces manual errors, helping you make data-driven decisions to enhance your SMS campaign strategies.

Transform Email Interactions with Smarter Engagement and Deliverability Enhancements

Enhance your email marketing and customer engagement with new conversational email capabilities, improved deliverability, and clearer reply management. Create dynamic two-way campaigns, boost inbox placement with streamlined Dedicated IP support.

Enhance WhatsApp Conversations with New Message Types and Optimization

Drive engagement with new interactive message templates for time-sensitive offers, business contacts, and stickers. Customers in Brazil can now receive payment options directly in the chat. Also, improve your delivery rates for marketing templates with Marketing Messages Lite.

Engage Mobile App Customers and Track Their Interactions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Make your purchase decisions only on the basis of generally available products and features.

Boost mobile app marketing and engagement with targeted in-app messages and near real-time flash notifications. Gain insights into customer behavior by tracking custom events like clicks, screen views, and purchases.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Advanced edition.

Connect with Mobile App Customers Directly by Using In-App Messages

Engage your customers in real time while they use your mobile app, and boost your marketing efforts by selecting in-app message types that align with your business objectives. Basic message types include Banner, Modal, and Full Screen, while Advanced message types include Push Primer, which prompts customers to turn on push notifications. You can configure the message display limit in the setup page. Marketers can build in-app messaging content and include the element in flows.

SEE ALSO | *Salesforce Help:* [Set Up Mobile App Messaging in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help:* [Marketing Cloud Flow Element: Send In-App Message](#) (can be outdated or unavailable during release preview)

Grab Customers' Attention with Flash Notifications

Enhance mobile app engagement and strengthen brand loyalty by sending time-sensitive flash messages to your customers in near real time. After you turn on the feature, marketers can create flash messages and include the element in flows.

SEE ALSO | *Salesforce Help:* [Create a Flash Sending Push Notification](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help:* [Marketing Cloud Flow Element: Send Flash Message](#) (can be outdated or unavailable during release preview)

Set Up and Monitor Behavioral Interactions of Customers with Mobile Apps

Track customer behavior by defining custom mobile app events for button clicks, screen views, or purchases within your mobile app. Marketers can stream these events in real time from a mobile app via the unified Marketing Cloud SDK. Leverage this data in Data 360 for segmentation and deeper insights, or in Flow Builder to create personalized customer journeys.

SEE ALSO | *Salesforce Help*: [Set Up Custom Mobile App Events](#) (can be outdated or unavailable during release preview)

Enhance SMS Tracking with UTM Links

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Now, create and use UTM links to track the performance of your SMS campaigns and identify which SMS messages drive the most traffic and conversions. Build personalized URLs with standard UTM and custom parameters while creating your SMS messages. This new enhancement reduces manual errors, helping you make data-driven decisions to enhance your SMS campaign strategies.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next Growth or Advanced edition and an add-on for Salesforce Message Credits for SMS or WhatsApp.

Transform Email Interactions with Smarter Engagement and Deliverability Enhancements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance your email marketing and customer engagement with new conversational email capabilities, improved deliverability, and clearer reply management. Create dynamic two-way campaigns, boost inbox placement with streamlined Dedicated IP support.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with access to Marketing Cloud Next Growth and Advanced editions.

Engage Customers with Two-Way Conversational Email

Turn one-way email broadcasts into dynamic, two-way interactions. Conversational Email engages customers through responsive, threaded conversations that are powered by Agentforce agents. Capture

high-intent replies, resolve customer queries, and deliver personalized support, without leaving the Salesforce platform.

Use Campaign Agent to easily create two-way conversational campaigns. Provide a user utterance or select an option in the campaign brief, and Campaign Agent generates a preview of a standard two-way email campaign. It automatically includes the flow elements needed to support two-way conversations with the Default Agent.

Flow Builder enhancements, including Wait Until Response and conversation forwarding enable customers to convert any existing one-way campaigns to two-way campaigns.

Maximize Deliverability with Dedicated IP Support

Improve inbox placement for high-volume email campaigns with dynamic Dedicated IP Address support. Unified Messaging now automatically transitions eligible high-volume senders from shared IP pools to dedicated IPs, helping you build and maintain a strong sender reputation, without manual provisioning or additional licenses.

Improve Email Experience with Native RMM Forwarding

We improved Reply Mail Management (RMM) forwarding to provide customer replies in full HTML formatting, mirroring modern email clients. Marketing specialists see clean, readable emails with preserved context—replacing the previous plain-text experience.

SEE ALSO | *Salesforce Help*: [Configure Reply Mail Management for a Unified Messaging Domain](#)

Enhance WhatsApp Conversations with New Message Types and Optimization

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Drive engagement with new interactive message templates for time-sensitive offers, business contacts, and stickers. Customers in Brazil can now receive payment options directly in the chat. Also, improve your delivery rates for marketing templates with Marketing Messages Lite.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Growth and Advanced editions.

Share Business Contact Details via Chat

To quickly transmit detailed personal or organizational information directly through WhatsApp, use Contact messages. Include details such as name, phone number, email, address, and organization titles for seamless customer follow-up.

SEE ALSO | *Salesforce Help*: [Send Contact Details](#) (can be outdated or unavailable during release preview)

Send Time-Sensitive Offers

Engage customers with time-sensitive promotions and coupons directly through WhatsApp. This new interactive message template includes an expiration setting on offers, which can encourage quick action and boost sales.

SEE ALSO | *Salesforce Help*: [Send Limited-Time Offers](#) (can be outdated or unavailable during release preview)

Enhance Conversations with Stickers

Elevate WhatsApp session messages by adding curated stickers, offering a fun and visual way to respond to customers. Marketers create these stickers in WEBP format, and then upload them to Content Builder in Marketing Cloud Next or a public hosting service to get a secure URL. After you send the stickers, your customers can download and forward them.

SEE ALSO | *Salesforce Help*: [Send Stickers in WhatsApp Session Messages](#) (can be outdated or unavailable during release preview)

Optimize Marketing Message Delivery with MM Lite

To maximize the effectiveness of WhatsApp marketing initiatives, enable Marketing Messages Lite (MM Lite) Setup. These optimizations for outbound marketing template messages are provided by Meta to achieve up to 5% better delivery rates and potentially higher return on ad spend.

SEE ALSO | *Salesforce Help*: [Enable MMLite in WhatsApp](#) (can be outdated or unavailable during release preview)

Send Payment Options in WhatsApp (Brazil Only)

WhatsApp payment message templates now support sending payment options to customers. Configure up to two payment methods, including Pix, Boletto, or Payment Links. This message template is currently available only for Brazil.

SEE ALSO | *Salesforce Help*: [Send Payment Options in WhatsApp](#) (can be outdated or unavailable during release preview)

Drive Better Outcomes with Improved Reporting Tools

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance your campaign reach and engagement with improved dashboards for mobile app performance and message deliverability. Use the new Conversion Analytics dashboard to measure attribution and outcomes.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next Growth and Advanced editions.

Gain Deeper Insights into Mobile App Metrics

Monitor mobile app campaign performance with unified dashboards for in-app messaging and push notifications. To view metrics specific to iOS or Android, marketers can now filter by platform. Plus, track delivery rates, dismissals, and CTA clicks to identify issues and improve marketing strategies.

SEE ALSO | *Salesforce Help*: [Metrics Formulas for Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

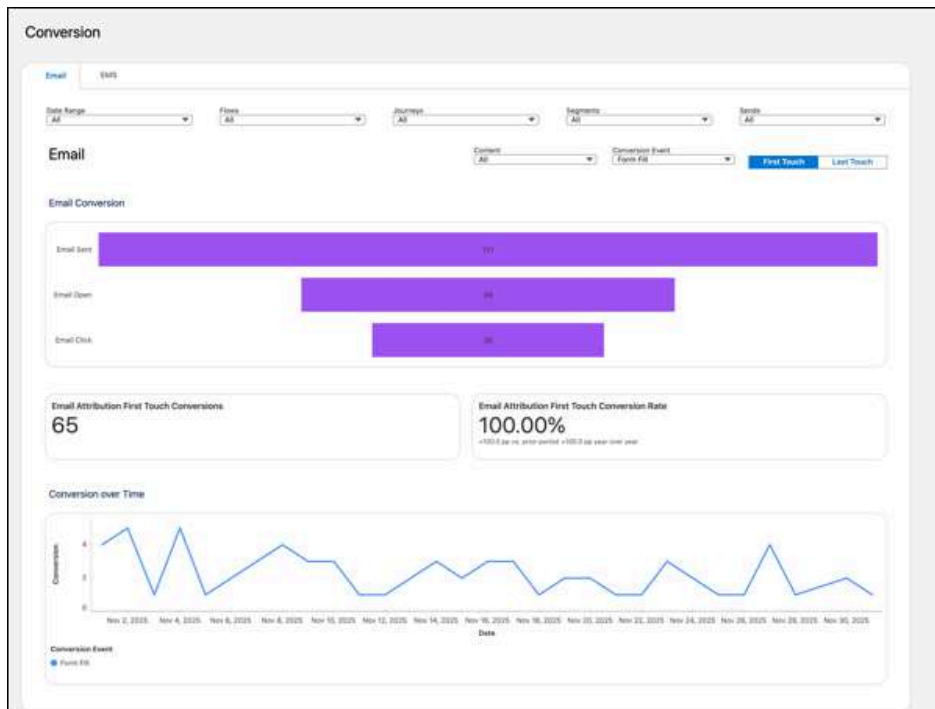

Track Deliverability Metrics for SMS, WhatsApp, and Mobile Push

You can now identify underperforming campaigns for SMS, WhatsApp, and Mobile Push by using the Low-Performing Campaign view. Apply delivery status filters to visualize activity trends and uncover reasons for unsuccessful deliveries.

SEE ALSO | *Salesforce Help*: [Metrics Formulas for Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

Measure Campaign Effectiveness with Conversion Analytics Dashboards

Gain insights into your marketing campaigns with the new Conversion Analytics dashboard. Track how email and SMS outreach drives specific outcomes, such as orders placed or form fills over a 30-day conversion window. To identify which messages convert customers most effectively, filter by First Touch or Last Touch attribution models.

SEE ALSO | *Salesforce Help*: [Metrics Formulas for Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

Other Changes in Marketing Cloud Next

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about other changes we made in Spring '26.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Growth and Advanced editions.

Set Up External Web Tracking in Fewer Steps

Use our improved setup process to configure external web tracking with greater speed and efficiency. Now, when you create a web connector, we automatically install and deploy the required data streams. Previously, users had to complete a manual install. You can also reuse the same web connector for multiple campaigns, eliminating the need to create a new connector for each campaign.

SEE ALSO | *Salesforce Help*: [Configure Web Tracking in Marketing Cloud Next](#) (can be outdated or unavailable during release preview)

Confidently Test Email Campaigns in a Sandbox

To prevent accidentally sending test messages to real customer email addresses, use the blackhole feature in your full or partial sandbox org. When you enable blackhole in a sandbox, the system automatically discards email messages before they're sent. You can also add exceptions for the recipient domains that need to receive test messages.

SEE ALSO | *Salesforce Help*: [Test Marketing Cloud in a Sandbox Org](#) (can be outdated or unavailable during release preview)

Updates to Related Features

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Marketing Cloud Account Engagement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Drive alignment across teams and close deals faster with Marketing Cloud Account Engagement for B2B marketers. Expand your communication channels by sending approved email, SMS, and WhatsApp content, and visualize engagement data in new Tableau Next dashboards. Connect your business units to Data 360 and Marketing Cloud Next with a streamlined setup and enhanced email consent management. Plus, explore improved security for Google Group sends.

Unify Data with Enhancements to Data 360 for Account Engagement

To unify customer interactions across touchpoints, you can now connect Account Engagement data from Data Cloud One companion orgs. Plus, install the required data kits with a single click when you connect an Account Engagement business unit to Data 360. Previously, you had to install or update the engagement activity data streams on a separate page in Data 360 Setup.

Match Overall Email Marketing Consent with Marketing Cloud Next

Send promotional emails with confidence. You can now match overall email consent between Account Engagement prospects and Marketing Cloud Next records. To track overall email consent changes between the two apps, turn on Consent Matching in the Account Engagement Settings tab in the Lightning App.

Track Engagement History with Tableau Next

Visualize every lead, contact, account, and person account interaction with Unified Engagement History Dashboards. Pull engagement data directly from Tableau Next to get immediate, actionable marketing insights based on your records in Salesforce CRM.

Send Approved Emails, SMS, and WhatsApp Content

Level up your connected Account Engagement content with Marketing Cloud Next. Distributed Marketing and Alerts shares marketing-approved templates with Salesforce Platform users, while Engagement Studio now offers steps that trigger SMS and WhatsApp sends through On-Demand Flows.

Google Adds “via” Tag to System Emails

System emails that are sent to Google Group email addresses now include a "via" tag in the From address.

Unify Data with Enhancements to Data 360 for Account Engagement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To unify customer interactions across touchpoints, you can now connect Account Engagement data from Data Cloud One companion orgs. Plus, install the required data kits with a single click when you connect an Account Engagement business unit to Data 360. Previously, you had to install or update the

engagement activity data streams on a separate page in Data 360 Setup.

Where: These changes apply to Salesforce Enterprise, Performance, and Unlimited editions with any Marketing Cloud Account Engagement edition.

Track Engagement History with Tableau Next

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Visualize every lead, contact, account, and person account interaction with Unified Engagement History Dashboards. Pull engagement data directly from Tableau Next to get immediate, actionable marketing insights based on your records in Salesforce CRM.

Where: This change applies to any Marketing Cloud Account Engagement edition with access to Tableau Next and with Data 360 enabled.

SEE ALSO | *Salesforce Help:* [Engagement History Dashboards](#) (can be outdated or unavailable during release preview)

Send Approved Emails, SMS, and WhatsApp Content

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Level up your connected Account Engagement content with Marketing Cloud Next. Distributed Marketing and Alerts shares marketing-approved templates with Salesforce Platform users, while Engagement Studio now offers steps that trigger SMS and WhatsApp sends through On-Demand Flows.

Where: This change applies to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next for Account Engagement.

Build Email Templates for Non-Marketing Users

Distributed Marketing and Alerts is a platform-based feature that functions similarly to Sales Emails and Alerts. Orgs with Marketing Cloud Next for Account Engagement can try it out after an admin enables the feature and adds the required Lightning web components to record pages.

SEE ALSO | *Salesforce Help:* [Distributed Marketing and Alerts Overview](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help:* [Set Up Distributed Marketing and Alerts](#) (can be outdated or unavailable during release preview)

Send SMS and WhatsApp Messages in Engagement Studio

Upgrade your marketing strategy with expanded messaging functionality. You can now add SMS and WhatsApp message types to your Engagement Studio programs, making it possible to reach prospects on their preferred channels. Extend the automation capabilities of your marketing campaigns by selecting On-Demand Flows from Salesforce to your Engagement Studio programs. To view the On-Demand Flows that are built in Flow Builder, use the Send to Flows action in Engagement Studio. This feature consumes add-on credits for SMS or WhatsApp messages.

Google Adds “via” Tag to System Emails

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

System emails that are sent to Google Group email addresses now include a "via" tag in the From address.

The “[via](#)” tag is a security feature that's added to a message sent on behalf of another sender or domain—in this case, a message from info@pardot.com for your domain. This tag helps prevent email spoofing and enhances security so that recipients can identify an email's true origin.

- **Old Format**—Marketing Cloud Account Engagement <info@pardot.com>
- **New Format**—“Marketing Cloud Account Engagement” via Group-Name” <YourGroup@Yourdomain.com>

Where: This change applies to Salesforce Enterprise, Performance, and Unlimited editions with any Marketing Cloud Account Engagement edition.

When: This change began on October 11, 2025.

SEE ALSO | *Salesforce Help*: [System Emails](#) (can be outdated or unavailable during release preview)

Marketing Cloud Engagement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Marketing Cloud Engagement delivers personalized customer journeys across marketing, advertising, commerce, and service. The Spring '26 Marketing Cloud Engagement release occurs January 16, 2026 through February 20, 2026.

Get an exclusive, in-depth look at the new features by tuning into the Spring '26 Marketing Cloud Engagement Release Panel webinar. Stay tuned for updates on this page.

[Transform Your Emails, Campaigns, and Data with Marketing Cloud Next for Engagement](#)

New features improve campaign reporting and data compatibility for Marketing Cloud Next. Marketers

can now send Engagement emails via flows, create lockable email templates for use by platform users, and view unified reporting in context.

Drive Conversions and Engagement with Advanced Messaging Capabilities

Connect with customers and improve data accuracy across your messaging channels. You can now guide users with call-to-action URLs, showcase products in catalogs, and process payments in Brazil on WhatsApp. Additionally, get cleaner metrics with SMS bot-click detection, and consistently share contact details via Virtual Contact Files (VCF).

Retain Original External Key Values in Package Manager

When you deploy entities with Package Manager, the original external key value that's specified in the originating account is retained. Journey Builder entry sources keep the event definition key value specified in the originating account. This feature makes it easier to deploy objects called by external APIs by removing the need for manual intervention.

Improve Event Notification Service (ENS) Reliability

The new 7-day retry window prevents users from experiencing dropped batches due to unsuccessful delivery attempts. When a batch of notification events fails to deliver, ENS retries delivery at periodic, decreasing intervals for up to 7 days. After that, retries stop and delivery fails. Previously, ENS suspended callback URLs immediately after a failed delivery.

Define Rotation Policies for Client Secrets

To improve the security of your API integrations, set a rotation policy for OAuth 2.0 client secrets. When you define a rotation period for an integration's client secret, your marketing admins get email reminders when a secret is ready to be rotated.

Get Einstein Metrics Guard Bot Scoring for Marketing Cloud Engagement

Turn on Einstein Metrics Guard to score bot-driven email engagement data in Marketing Cloud Engagement using data from Data 360. This feature provides a clearer picture of campaign performance by identifying non-human opens and clicks.

Archived Release Notes

Marketing Cloud Engagement release notes from Spring '24 and earlier are available for PDF download. To find updates from Summer '24 through our last release, select a release from the dropdown menu in the toolbar.

Transform Your Emails, Campaigns, and Data with Marketing Cloud Next for Engagement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

New features improve campaign reporting and data compatibility for Marketing Cloud Next. Marketers can now send Engagement emails via flows, create lockable email templates for use by platform users,

and view unified reporting in context.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud Next for Engagement.

Build Email Templates for Non-Marketing Users

Distributed Marketing and Alerts functions similarly to the Distributed Marketing functionality that you're used to. Orgs with Marketing Cloud Next for Engagement can try it out after an admin turns on the feature and adds the required Lightning web components to record pages.

SEE ALSO | *Salesforce Help*: [Distributed Marketing and Alerts Overview](#) (can be outdated or unavailable during release preview)

SEE ALSO | *Salesforce Help*: [Set Up Distributed Marketing and Alerts](#) (can be outdated or unavailable during release preview)

Enhance Campaign Reporting with Related Emails

The Marketing Cloud Next campaign record experience continues to evolve for Engagement customers, making it easier for marketers to view, manage, and report on multichannel orchestration. You can now send Marketing Cloud Engagement emails from flows in the Marketing App. On campaign records, we added the Engagement email send element in the Next Steps section and a unified report to the Performance tab.

SEE ALSO | *Salesforce Help*: [Automate Marketing Cloud Engagement Emails from Flow](#) (can be outdated or unavailable during release preview)

Unify Legacy Engagement Data for Marketing Cloud Next

Now you can unify your legacy Marketing Cloud Engagement data to use with Marketing Cloud Next. To make sure that incoming and existing Engagement data is compatible with newer features, such as Marketing Performance reports, update your data configuration. Previously, some users with an older data model couldn't unify their Engagement data in Marketing Cloud Next.

Where: These changes don't apply to the majority of Engagement customers. To confirm if your account requires this configuration, from Salesforce Setup, in the Quick Find box, enter *Marketing Cloud Engagement* and then select **Unify Data**. If Setup doesn't include a Unify Data page, the changes don't apply to your org.

SEE ALSO | *Salesforce Help*: [Unify Legacy Engagement Data](#) (can be outdated or unavailable during release preview)

Drive Conversions and Engagement with Advanced Messaging Capabilities

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Connect with customers and improve data accuracy across your messaging channels. You can now guide users with call-to-action URLs, showcase products in catalogs, and process payments in Brazil on WhatsApp. Additionally, get cleaner metrics with SMS bot-click detection, and consistently share contact details via Virtual Contact Files (VCF).

Where: These changes apply to Marketing Cloud Engagement Corporate and Enterprise editions.

Guide Customers with Call-to-Action URLs

Easily direct your users to relevant resources by including a Call-to-Action URL in your WhatsApp messages. A marketer defines the button text and a specific URL to provide users with a clear next step.

SEE ALSO | *Salesforce Help:* [Add Call-to-Action URLs](#) (can be outdated or unavailable during release preview)

Drive Sales with Single and Multi-Catalog Messages

Make it easier for customers to purchase items by sending single or multi-product catalog messages directly through WhatsApp. Marketers can configure Multi-Product Templates that display up to 30 products organized in 10 sections, linking directly to your catalog and product IDs.

SEE ALSO | *Salesforce Help:* [Send Catalog Messages](#) (can be outdated or unavailable during release preview)

Send Payment Options in WhatsApp (Brazil Only)

WhatsApp payment message templates now support sending payment options to customers in Brazil. Configure up to two payment methods, including Pix, Boletto, or Payment Links. This message template is currently available only for Brazil.

SEE ALSO | *Salesforce Help:* [Send Payment Options Messages](#) (can be outdated or unavailable during release preview)

Optimize Marketing Message Delivery with MM Lite

Unified Messaging customers can now maximize the effectiveness of WhatsApp marketing initiatives with Marketing Messages Lite (MM Lite). These optimizations for outbound marketing template messages are provided by Meta to achieve up to 5% better delivery rates and potentially higher return on ad spend.

SEE ALSO | *Salesforce Help*: [Enable MMLite in WhatsApp](#) (can be outdated or unavailable during release preview)

Enhance Contact Saving with Virtual Contact File Support

Make it easy for your subscribers to save your business contact information instantly. Marketers can now upload Virtual Contact File (VCF) contact cards in Content Builder and send them as MMS attachments through MobileConnect and Journey Builder.

SEE ALSO | *Salesforce Help*: [Supported File Types](#) (can be outdated or unavailable during release preview)

Measure Accurate SMS Engagement with Bot-Click Detection

Bot-click detection metric was added to the SMS Link Clicks report and to Journey Builder activities. Assess the true engagement of SMS campaigns with automatic bot-click detection, providing reliable human-validated clicks metrics and eliminating bot-triggered journeys.

SEE ALSO | *Salesforce Help*: [SMS Link Clicks Report](#) (can be outdated or unavailable during release preview)

Retain Original External Key Values in Package Manager

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

When you deploy entities with Package Manager, the original external key value that's specified in the originating account is retained. Journey Builder entry sources keep the event definition key value specified in the originating account. This feature makes it easier to deploy objects called by external APIs by removing the need for manual intervention.

Where: Journey Builder changes apply to Corporate and Enterprise editions, and to Professional editions with the Journey Builder add-on. Other changes apply to any Marketing Cloud Engagement edition.

Why: These entities are supported.

- Journey Builder Entry Source Event Definition Key
- Data Extension External Key
- Shared Data Extension External Key
- Email Triggered Send External Key
- Email User-Initiated Send External Key

Improve Event Notification Service (ENS) Reliability

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The new 7-day retry window prevents users from experiencing dropped batches due to unsuccessful delivery attempts. When a batch of notification events fails to deliver, ENS retries delivery at periodic, decreasing intervals for up to 7 days. After that, retries stop and delivery fails. Previously, ENS suspended callback URLs immediately after a failed delivery.

Where: This change applies to all Marketing Cloud Engagement editions.

SEE ALSO | *Developer Guide:* [Retries and Callback Suspensions](#) (can be outdated or unavailable during release preview)

Define Rotation Policies for Client Secrets

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To improve the security of your API integrations, set a rotation policy for OAuth 2.0 client secrets. When you define a rotation period for an integration's client secret, your marketing admins get email reminders when a secret is ready to be rotated.

Where: This change applies to Marketing Cloud Engagement Pro, Corporate, and Enterprise editions.

How: When you create an OAuth 2.0 integration in Setup, select a period from the Target Secret Rotation Period dropdown list. For existing integrations, stage a new client secret, and then select a period from

the Target Secret Rotation Period dropdown list.

Get Einstein Metrics Guard Bot Scoring for Marketing Cloud Engagement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Turn on Einstein Metrics Guard to score bot-driven email engagement data in Marketing Cloud Engagement using data from Data 360. This feature provides a clearer picture of campaign performance by identifying non-human opens and clicks.

Where: These changes apply to Marketing Cloud Engagement Corporate and Enterprise editions.

Who: Einstein Metrics Guard is available in orgs where Data 360 is activated and connected to Marketing Cloud Engagement via the Marketing Cloud Engagement Connector.

Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Marketing Intelligence in Marketing Cloud Next delivers more control, flexibility, and insight in Spring '26. Expand your data model, unify more sources with new API connectors, gain deeper visibility with enhanced dashboard views, and optimize campaigns with improved objective-based insights.

Unlock Deeper Insights with Improved Data Management

Unify custom datasets, streamline processing, and integrate more campaign sources. This release empowers you to extend the Semantic Data Model (SDM) and enrich your data. These updates give you cleaner data and better attribution insights to make more confident decisions.

Drive Strategy with Advanced Marketing Analytics Insights

We've enhanced analytics capabilities to help you uncover actionable insights and make more informed decisions faster.

Get a Unified View with the Marketing Intelligence Home Tab

We've updated the Marketing Intelligence Home page to help you see key results instantly, spot trends quickly, and act on insights faster, all without switching between screens. Get a quick, high-level overview of campaign performance in the My Campaigns Home widget. A toggle lets you switch between individual campaigns and aggregate anchor campaigns, so that you can track results across all campaign groups at a glance.

Improve Results with the Enhanced Paid Media Optimization Agent

We've upgraded the Paid Media Optimization Agent to help you make smarter decisions, optimize campaigns efficiently, and act on insights with speed and clarity.

Unlock Deeper Insights with Improved Data Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Unify custom datasets, streamline processing, and integrate more campaign sources. This release empowers you to extend the Semantic Data Model (SDM) and enrich your data. These updates give you cleaner data and better attribution insights to make more confident decisions.

Where: These changes apply to Lightning Experience in Salesforce Enterprise, Performance, Unlimited, and Developer editions with Marketing Intelligence in Marketing Cloud Next.

Customize Field Mappings in API Data Pipelines

You can now map unmapped source fields from API connectors directly to the Semantic Data Model. Bring additional data into Marketing Intelligence by adding custom destination fields to predefined mappings or create entirely new mappings for unique fields. Standard system mappings remain locked to ensure stability.

Run Multi-Touch Attribution per Conversion Event

Configure Multi-Touch Attribution (MTA) for specific conversion events and their associated engagement signals. Create distinct attribution setups for different conversion events, such as purchases versus sign-ups, within a single Data Space. Compare attribution models side-by-side to analyze how interactions contribute to each unique outcome.

Expand the Data Model with Business-Specific Data

You can now expand the standard marketing data model to include business-specific entities, such as Influencers, or internal tracking fields like Project Codes. Use custom schema to map these unique data points directly into the Semantic Data Model for a more complete view of your marketing performance.

Access More Data Sources with New API Connectors

Bring in more campaign and performance data with new API connectors. Simplify data ingestion from additional platforms, making it easier to unify and analyze cross-channel marketing performance. We've also increased the reprocessing limit, allowing you to reprocess data for any 30-day date range.

New connectors include:

- Adform
- Criteo Marketing
- Criteo Retail
- Kakao Ads
- LinkedIn Company

Drive Strategy with Advanced Marketing Analytics Insights

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

We've enhanced analytics capabilities to help you uncover actionable insights and make more informed decisions faster.

Where: These changes apply to Lightning Experience in Salesforce Enterprise, Performance, Unlimited, and Developer editions with Marketing Intelligence in Marketing Cloud Next.

Group Related Campaigns for Unified Performance Analysis

Simplify campaign management by grouping multi-channel efforts into Anchor Campaigns. Functioning as a strategic parent layer, Anchor Campaigns aggregate data from multiple sources to reveal the true ROI of your initiatives. Use this unified view to optimize campaigns against business objectives and reduce the manual effort needed for faster, data-driven decisions.

Explore More Views into Segment and Campaign Performance

Gain a broader view of how your marketing performs across channels and attribution models. Segment Intelligence now shows performance across paid channels like Meta and Google, and owned channels like Email and SMS. Compare engagement, conversions, and ROI over time, drill into demographics, and uncover high-performing segments. Attribution dashboards now show B2C and B2B campaigns across multiple attribution models. See channel level performance, spend, conversions, and ROI for each conversion type to compare models, optimize media spend, and act with confidence.

Get Clear Campaign Performance Insights Across All Your Dashboards

You can now add Campaign Summary to any dashboard you create, giving you a clear, consistent view of campaign performance. The summary updates automatically with all applied filters, so you can quickly see the data that matters most. This helps you spot trends, find opportunities, and optimize ads faster using the Optimize call to action without switching dashboards.

Get a Unified View with the Marketing Intelligence Home Tab

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Where: This change applies to Lightning Experience in Salesforce Enterprise, Performance, Unlimited, and Developer editions with Marketing Intelligence in Marketing Cloud Next.

Improve Results with the Enhanced Paid Media Optimization Agent

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

We've upgraded the Paid Media Optimization Agent to help you make smarter decisions, optimize campaigns efficiently, and act on insights with speed and clarity.

Where: These changes apply to Lightning Experience in Salesforce Enterprise, Performance, Unlimited, and Developer editions with Marketing Intelligence in Marketing Cloud Next.

Create Goals Based on Agent Recommendations

The Paid Media Optimization agent now recommends goals that align with your filtered data and optimized metrics after campaign optimization is complete. Create these goals directly from the agent, and they appear in the Goals tab where marketers can view or edit them. This enhancement makes it easy to turn optimization recommendations into trackable objectives and monitor performance without extra setup.

Optimize Campaigns by Marketing Objectives

Identify which campaigns support your top objectives, review spend for low performing ads, and use the insights to improve performance. See where your budget has the most impact and make faster decisions that improve results across channels.

Salesforce Personalization in Marketing Cloud Next

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Drive real-time personalization decisions in mobile experiences using the Personalization module in Data 360 Engagement Mobile SDK. Dynamically adapt your website's content, imagery, and tone in real-time based on user behavior signals.

Personalization Features Released by Month

Salesforce Personalization and Marketing Cloud Personalization features and changes are released as often as monthly, so check back again soon for the latest updates. When announced, changes included in the Spring release will appear under January '26.

Curate Website Content with Agentforce Adaptive Websites

Guide your users through every step of their website browsing journey by dynamically curating relevant, context-aware site content in real time. Agentforce Adaptive Websites displays the right recommendations, images, and adapts messaging tone based on real-time user behavior signals from an SDK combined with your data. Keep your customers engaged and assist them in accomplishing their mission without leaving your brand's site.

Personalize Mobile Experiences with Engagement Mobile SDK

The Personalization module within the Engagement Mobile SDK queries the Personalization service to deliver targeted content to your iOS and Android apps. By integrating with the Data 360 module, you capture customer interactions and build behavior profiles. Use the returned data to drive real-time personalization decisions.

Loyalty Management in Marketing Cloud Next

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve member benefits by enabling partner linkage and creating digital passes. Standardize the points expiration process and boost performance with asynchronous processing of high volumes of data. Target your audience better using unified individuals and set up data graphs in companion orgs.

Get Added Benefits by Linking Your Loyalty Memberships

Members can now link their membership with partner loyalty memberships to seamlessly access valuable co-branded rewards, such as personalized offers. Linking memberships provides members with additional benefits in the home loyalty program. For example, link a Marriott Bonvoy membership in the Uber app to earn Bonvoy points by taking an Uber ride. Members can use their iOS or Android mobile devices to link their loyalty program memberships from a partner's app.

Integrate Loyalty Programs Seamlessly with Google Wallet

Drive customer engagement by integrating your loyalty program with Google Wallet. Members can create digital passes and conveniently access their full loyalty member profile on their mobile device. This ease of use encourages members to use their loyalty rewards and boosts program participation. Members can use their iOS or Android mobile devices to add their digital passes to the Google Wallet app.

Global Promotions Management

Increase customer cart size with volume-based promotions such as Buy 100 LevelIX Batteries to Get 10% Off on 20 Battery Testers. Reward customers with free products with easily relatable promotions such as Buy-One-Get-One-Free (BOGO). Show promotions to store employees, assisted sellers, and customers in their preferred languages. Run promotions on ecommerce sites powered by Experience

Cloud. Assign permissions sets to users based on their roles. Create promotions for large product sets with ease. Find eligible promotions for items from across all their categories. Explain to customers and sellers why manually added coupons weren't applied to carts.

Boost Performance with Asynchronous Processing of High-Volume Redemption Transactions

Process traceable redemption transactions asynchronously to handle high redemption volumes more effectively. Optimize batch processing of redemptions and currency sub-type roll-ups during traceability to improve performance and scalability.

Optimize Point Accounting with Accurate Expiration of Points

Use the Expire Fixed Non-Qualifying Points Using Aggregation Ledgers and Traceable Ledgers Data Processing Engine definition template to automate the precise expiration of fixed-type non-qualifying points. Ensure accurate point expiration by processing only points without pending traceability ledgers. The template leverages Aggregated Point Expiration Ledger records to calculate and expire points for members and currencies.

Data 360 for Loyalty Management

Enhance your audience targeting by using unified individual segments and improve data accuracy by setting up data graphs in companion orgs.

Standardize Point Expiration by Using Current Date

Standardize your point expiration processes by using real-time calculations with a capability to check whether the run date for a Data Processing Engine definition is in the future. The future run date is automatically replaced with the current date.

Refine User Access with New Loyalty Management Permission Sets

Update your user assignments with new permission sets to ensure that your admins and loyalty program managers maintain the correct access to Loyalty Management features.

New and Changed Objects in Loyalty Management

Do more with the new and updated Loyalty Management objects.

Get Added Benefits by Linking Your Loyalty Memberships

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Members can now link their membership with partner loyalty memberships to seamlessly access valuable co-branded rewards, such as personalized offers. Linking memberships provides members with additional benefits in the home loyalty program. For example, link a Marriott Bonvoy membership in the Uber app to earn Bonvoy points by taking an Uber ride. Members can use their iOS or Android mobile devices to link their loyalty program memberships from a partner's app.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management.

Integrate Loyalty Programs Seamlessly with Google Wallet

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Drive customer engagement by integrating your loyalty program with Google Wallet. Members can create digital passes and conveniently access their full loyalty member profile on their mobile device. This ease of use encourages members to use their loyalty rewards and boosts program participation. Members can use their iOS or Android mobile devices to add their digital passes to the Google Wallet app.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management.

 **Important** Google Wallet Integration with Loyalty Management is a third-party service provider which is integrated with Salesforce Loyalty Management system and Salesforce is enabling its customers to use this at their own option and discretion. Customers will have the option to pass-on the information it opts for its own customers so that the customers experiences can be powered. Customers can invoke the Google Wallet API and the API would consume the information through Loyalty Management system which will be shown on the Google Wallet Digital Pass.

Global Promotions Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Increase customer cart size with volume-based promotions such as Buy 100 LevelIX Batteries to Get 10% Off on 20 Battery Testers. Reward customers with free products with easily relatable promotions such as Buy-One-Get-One-Free (BOGO). Show promotions to store employees, assisted sellers, and customers in their preferred languages. Run promotions on ecommerce sites powered by Experience Cloud. Assign permissions sets to users based on their roles. Create promotions for large product sets with ease. Find eligible promotions for items from across all their categories. Explain to customers and sellers why manually added coupons weren't applied to carts.

Drive Higher Unit Sales with Recurring Incentives

Motivate customers to purchase higher quantities of an item by rewarding them with free or

discounted units. Delight customers with promotions such as Buy-One-Get-One-Free (BOGO) that customers can apply to their cart multiple times. Scale volume-based discounts with promotions such as For Every 10 Crates You Buy, Get 5% Off on 2 Crates and For Every 20 Crates You Buy, Get 3 Crates Free.

Show Promotions to People in Their Preferred Language

Increase usage of promotions and assist sales motions by showing promotions to in-store employees and sales reps who manage assisted sales in the preferred language. Show customers promotions in their language on Experience Cloud sites.

Scan All Categories for Eligible Promotions

Increase efficiency by selecting only the parent category that's eligible for a promotion. Marketing managers can now skip selecting large sets of eligible child categories. The Eligible Promotions API and the Promotion Evaluation and Execution API now check promotion eligibility of products across five levels of its related category hierarchies.

Add Rewards for All Eligible Categories and Products

Create unit price promotions for a large volume of eligible products and categories in no time. Add one purchase criterion for all eligible products or categories. Configure a uniform reward for all eligible items.

Run Promotions on Sites Powered by Experience Cloud

Show eligible promotions to logged-in customers on Experience Cloud site pages. When customers place an order from site pages, eligible promotions are evaluated and applied on the order.

Communicate Reasons for Coupon Ineligibility

The Promotion Evaluation and Execution API provides customers and sellers the exact reason why a manual coupon isn't applied on order placement. The reasons can include invalid date of use and exceeded usage limit.

Refine User Access with New Global Promotions Management Permission Sets

Enhance data security and administrative control by transitioning users to new Global Promotions Management permission sets. Assign permission sets in precise groupings to control data access based on business requirements.

Drive Higher Unit Sales with Recurring Incentives

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Motivate customers to purchase higher quantities of an item by rewarding them with free or discounted units. Delight customers with promotions such as Buy-One-Get-One-Free (BOGO) that customers can apply to their cart multiple times. Scale volume-based discounts with promotions such as For Every 10 Crates You Buy, Get 5% Off on 2 Crates and For Every 20 Crates You Buy, Get 3 Crates Free.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Global Promotions Management.

How: Go to Global Promotions Management Settings in Setup. Turn on Promotion Evaluation and Execution to use the enhanced Buy X, Get Unit Price Discount on Y + Rewards template.

The screenshot shows the configuration for a promotion titled "Buy X, Get Unit Price Discount on Y + Rewards". At the top, there are fields for "Priority" (set to 1) and "Rule Name" (set to BOGO). Below this, there are two main sections: "What Customers Do" and "What Customers Get".

What Customers Do: This section has a dropdown menu showing "Customers purchase select products or products from select categories". Below this, there is a condition: "Any of Men's Casual Shirt with Every Purchase Quantity of 2".

What Customers Get: This section has a dropdown menu showing "Free Product". Below this, there is a reward configuration: "Applicable for All Customers" and "Give 1 of Men's Casual Shirt for free". At the bottom of this section, there is a button labeled "+ Add Reward".

Show Promotions to People in Their Preferred Language

This release is in preview

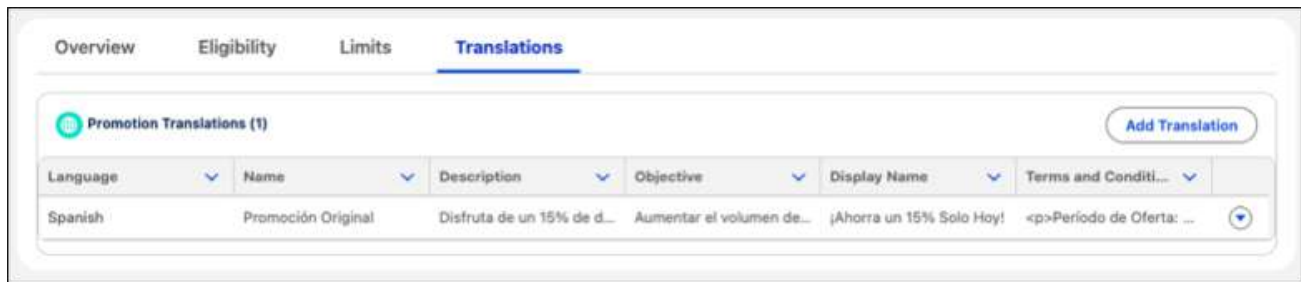

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Enhance data security and administrative control by transitioning users to new Global Promotions Management permission sets. Assign permission sets in precise groupings to control data access based on business requirements.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Global Promotions Management.

Boost Performance with Asynchronous Processing of High-Volume Redemption Transactions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Process traceable redemption transactions asynchronously to handle high redemption volumes more effectively. Optimize batch processing of redemptions and currency sub-type roll-ups during traceability to improve performance and scalability.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management.

How: On the Loyalty Management Settings page, turn on **Processes traceable redemption transactions asynchronously to handle a high volume of data**.

Optimize Point Accounting with Accurate Expiration of Points

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the Expire Fixed Non-Qualifying Points Using Aggregation Ledgers and Traceable Ledgers Data Processing Engine definition template to automate the precise expiration of fixed-type non-qualifying points. Ensure accurate point expiration by processing only points without pending traceability ledgers. The template leverages Aggregated Point Expiration Ledger records to calculate and expire points for members and currencies.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management.

Data 360 for Loyalty Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance your audience targeting by using unified individual segments and improve data accuracy by setting up data graphs in companion orgs.

Enhance Audience Targeting with Unified Individuals

You can now access the data of Unified Individual segments from the home org and companion orgs. Unified Individual segments manage duplicate records and provide a single source of truth for accurate segmentation and effective audience targeting.

Set Up Data Graphs in Companion Orgs

Verify a member's Data 360 segment by using data graphs in companion orgs. Previously, you could use data graphs only in the home org.

Enhance Audience Targeting with Unified Individuals

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now access the data of Unified Individual segments from the home org and companion orgs. Unified Individual segments manage duplicate records and provide a single source of truth for accurate segmentation and effective audience targeting.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management and Data 360.

Set Up Data Graphs in Companion Orgs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Verify a member's Data 360 segment by using data graphs in companion orgs. Previously, you could use data graphs only in the home org.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management and Data 360.

Standardize Point Expiration by Using Current Date

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Standardize your point expiration processes by using real-time calculations with a capability to check whether the run date for a Data Processing Engine definition is in the future. The future run date is automatically replaced with the current date.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management.

Why: These enhanced Data Processing Engine definition templates now verify the run date.

- Reset Qualifying Points
- Expire Fixed Non-Qualifying Points
- Expire Activity Based Non-Qualifying Points
- Expire Fixed Non-Qualifying Points Using Aggregated Expiration Ledgers
- Expire Non-Qualifying Points Using Traceability Loyalty Ledgers
- Expire Fixed Non-Qualifying Points Using Aggregation Ledgers and Trace Ledgers

How: To get the latest updates, replace the existing Data Processing Engine definition templates with the enhanced templates.

Refine User Access with New Loyalty Management Permission Sets

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Update your user assignments with new permission sets to ensure that your admins and loyalty program managers maintain the correct access to Loyalty Management features.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Loyalty Management.

New and Changed Objects in Loyalty Management

This release is in preview

Issue digital passes for loyalty program members

Use the new Digital Pass object.

Get the processing status of traceable records and the order of processing of currency subtypes

Use the **ProcessingStatus** and **ProcessingSequenceInfo** fields on the existing Loyalty Ledger Traceability object.

Referral Marketing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Connect outbound engagements with business units in Marketing Cloud Next. Use unified segments to enhance audience targeting and companion org data graphs to improve data accuracy.

Accelerate Engagement by Connecting Journeys to Marketing Cloud Business Units

Connect outbound engagements to Marketing Cloud Next business units. Use journeys to send promotion launch emails to your target audience. Marketing Cloud Next business units help you control information access and sharing based on defined user roles.

Data 360 for Referral Marketing

Enhance your audience targeting by using unified individual segments and improve data accuracy by setting up data graphs in companion orgs.

Accelerate Engagement by Connecting Journeys to Marketing Cloud Business Units

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. MuleSoft

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the MuleSoft Anypoint Platform suite of products to connect and integrate apps, systems, and data across your enterprise. Streamline operations by building and automating processes with clicks instead of code. You can design, develop, govern, and share APIs and integration apps and host them in the cloud or on-premises.

MuleSoft features and integrations span Anypoint Platform and Salesforce to provide API and agent management. To learn more about MuleSoft products, see [MuleSoft Documentation](#).

- The [Mulesoft Release Notes](#) are organized by product.
- The [MuleSoft Release Note Summary by Month](#) is organized by latest updates.

[MuleSoft API Catalog for Salesforce](#)

Manage and view your APIs and make them available to use in Salesforce. You can bring APIs into your catalog from several different sources, including MuleSoft, Heroku, Apex, and Named Query API. API Catalog helps you create connections for your APIs and activate actions to use in Salesforce automations, such as flows and Agentforce.

[MuleSoft API Governance for Salesforce \(Beta\)](#)

Create policies to protect your MuleSoft and Heroku API connections. These policies apply only to agent actions that access the connections. You can control access, set usage limits, and follow best practices for governance.

Salesforce Mobile App Requirements Have Changed

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce revises the requirements for using the Salesforce mobile app for iOS and Android. Learn about the mobile platform requirements and the devices that we use for feature and performance testing as we continue to improve the Salesforce experience.

Mobile Platform Requirements

The Salesforce mobile app is supported on phones and tablets that meet these mobile platform requirements.

Operating System and Version Requirements
Android 11.0 or later, Android WebView 90.0 or later
iOS 17.0 or later

To allow for innovation and to keep Salesforce current in the rapidly evolving mobile market, minimum

platform requirements are subject to change at the sole discretion of Salesforce, with or without advance notice.

Mobile Devices Used for Salesforce Testing

Salesforce performs automated and manual testing of the Salesforce mobile app for iOS and Android on a select set of mobile devices. Salesforce periodically updates our test devices based on usage and new device releases. Here's the current list of devices.

Platform	Phones	Tablets
Android	• Pixel 10 • Pixel 9 / 9 Pro • Pixel 7 / 7 Pro • Samsung Galaxy S24 Ultra • Samsung Galaxy S23/23 Ultra • Samsung Galaxy S22/22 Ultra • Samsung Galaxy S21 • Samsung Galaxy S20 / S20+	• Samsung Galaxy Tab S6 • Samsung Galaxy Tab S7 • Samsung Galaxy Tab A (8 inch)
iOS	• iPhone 17 Pro / Pro Max • iPhone 17 / iPhone 17 Air • iPhone 16 Pro / Pro Max • iPhone 16 / 16 Plus • iPhone 15 Pro / Pro Max • iPhone 15 / 15 Plus • iPhone 15 Pro / Pro Max • iPhone 14 Pro / Pro Max • iPhone 14 / 14 Plus • iPhone 13 Pro / Pro Max • iPhone 13 • iPhone 12 Pro / Pro Max • iPhone 12 • iPhone XR • iPhone 11 • iPhone SE	• iPad Pro (10.5 inch - 12.9 inch) • iPad Pro (9.7 inch, 6th generation and later) • iPad Air 3rd Gen • iPad Mini 5th Gen

Using the mobile app on untested devices can lead to various functional and performance issues. Salesforce may not be able to replicate specific issues on untested devices or due to manufacturer-specific customizations. In certain situations, Salesforce may not be able to resolve a specific issue on untested devices which can lead to downtime and production impact.

To allow for innovation and to keep Salesforce current in the rapidly evolving mobile market, the list of

Salesforce-tested devices is subject to change at the sole discretion of Salesforce, with or without advance notice.

Complete Tasks Directly from Custom Phone Notifications (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Users can now complete tasks directly from custom phone notifications on their Salesforce mobile app. Let's say your VP of sales wants to approve an expense report. They can do that on the fly just from a notification received on their mobile phone. A task that before took four clicks has now been streamlined into one.

Where: This change applies to the Salesforce mobile app for iOS and Android on phones and tablets in all editions, except Database.com.

Actionable notifications is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

How: You can now add actions to custom notifications. These notifications appear on a user's lock screen, depending on their settings, and are used for various actions, such as approving requests, following up on deals that are at risk, or closing a case.

Actionable

notifications

See [Salesforce Help: Add a Mobile Action Group for Actionable Notifications \(Beta\)](#) (can be outdated or unavailable during release preview)

iOS/Android

Access Record Attachments in the Offline App with Files Priming (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

When you create or update a briefcase to select records to prime for the Offline App (Salesforce Mobile App Plus), you can now also include files attached to the selected records. The Files Priming feature,

which was previously in beta, is now generally available. When you prime file attachments for offline use, you enable your mobile workforce to access important attachments even in low-connectivity settings. For example, you can configure a briefcase to prime attached images for offline use, so that technicians can view the images during site visits or service appointments.

Where: This change applies to the Salesforce Mobile App Plus for iOS and Android on phone and tablets in all editions, except Database.com.

Who: Mobile Offline is available in orgs with the Salesforce Mobile App Plus license and to users within that org who have the Mobile Offline for Salesforce Mobile App Plus user permission.

How: From Setup, in the Quick Find box, enter *Briefcase Builder*, and then select **Briefcase Builder**. Update the briefcase associated with the Offline App, or create a briefcase. In the settings of an object rule, select **Enable file attachments**.

Easily Configure Offline App Landing Pages with Mobile Builder (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Mobile Builder for Salesforce Mobile App you can customize offline landing pages for your mobile users without writing a single line of code. Now you can show the most important records to your mobile users so they can quickly and easily take relevant actions based on their use cases. Mobile Builder was beta in Spring '24 and is now generally available.

Where: These changes apply to Salesforce Mobile App Plus for Android and iOS on phones and tablets in all editions, except Database.com.

Who: Mobile Builder is available to users in orgs with the Salesforce Mobile App Plus license who have the user permission Mobile Offline for Salesforce Mobile App Plus.

How: From Setup, in the Quick Find box, enter *Mobile Builder*, and then select **Mobile Builder for Salesforce Mobile App**. Create configurations, assign them to user profiles, and publish.

Log In Faster with Single Sign-On

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Leverage quicker access to the Salesforce Mobile App so you can get straight to work. The Salesforce Mobile App now also supports single sign-on (SSO) when logging in with your email address instead of a username, streamlining your login experience.

Where: This change applies to all versions of the mobile app in all editions, in production orgs only.

When: This change is available for iOS starting January 12, 2026 and Android starting February 23, 2026.

How: Select **Production - Log in with email** from the Connection gear on the mobile login screen.

General Mobile Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use natural language to create mobile and offline ready Lightning Web components with Mobile MCP tools.

[Mobile MCP Tools Now Available on Salesforce DX MCP Server \(Beta\)](#)

The Mobile Model Context Protocol (MCP) tools help developers create Lightning web components that adhere to Mobile Offline design patterns and integrate with device-native features.

Mobile MCP Tools Now Available on Salesforce DX MCP Server (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Mobile Model Context Protocol (MCP) tools help developers create Lightning web components that adhere to Mobile Offline design patterns and integrate with device-native features.

Note Salesforce DX MCP Server is a pilot or beta service that is subject to the Beta Services Terms at Agreements - Salesforce.com or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the Product Terms Directory. Use of this pilot or beta service is at the Customer's sole discretion.

Where: The Mobile MCP tools are available in version 0.21.2 of the Salesforce MCP DX Server (Beta).

Why: The Mobile Offline MCP Tools provide comprehensive offline compatibility analysis and guidance for Lightning web components that work with offline-supported apps like Salesforce Mobile App Plus and the Field Service Mobile App.

The Mobile Native Capabilities MCP tools provide grounding context for creating Lightning web components that integrate with device-native capabilities such as barcode scanning, location services, contact access, and other mobile-specific features

How: Use the `--toolsets` flag to specify the toolsets when you configure the Salesforce DX MCP Server.

- `mobile` toolset: Tools for creating Lightning web components that integrate with device-native capabilities such as contact access, document scanning, and other mobile device related features.
- `mobile-core` toolset: A subset of tools from the mobile toolset focused on development, testing, and optimization of offline capable Lightning web components and the most essential device-native capabilities.

For more information on configuring toolsets with the Salesforce DX MCP Server, see [Install and Configure the Salesforce DX MCP Server \(Beta\)](#)

OmniStudio

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Validate your workflows built with Omniscripts and Flexcards end-to-end by using the UI Test Automation Model (UTAM) framework. For a fast, scalable experience, add Omniscripts and Flexcards to Lightning Web Runtime (LWR) Experience Cloud sites (pilot). Get immediate help with an Omnistudio component or element with the Omnistudio Assistance AI Agent (pilot). With accessibility improvements for Omniscripts and Flexcards, create inclusive workflows and solutions for customers and users with disabilities. Filter empty records in Omnistudio Data Mapper Extract and Turbo Extract components with the Is Null operator.

Automate UI Testing for Omniscripts and Flexcards

Omnistudio now supports comprehensive UI testing for guided experiences and visual components by using the UI Test Automation Model (UTAM) framework. UTAM improves deployment reliability by validating end-to-end workflows. Write UI-driven tests for Omniscripts and Flexcards that validate full user journeys exactly as they appear on screen. UTAM interacts directly with the interface to test user inputs, navigation, actions, data rendering, and visual states.

Get Instant Product Assistance and Troubleshooting with Omnistudio Assistance AI Agent (Pilot)

Use the Omnistudio Assistance AI pilot agent to get context-aware guidance directly in the designer. Whether you're a designer, developer, or implementation specialist, the agent provides instant, relevant information about any Omnistudio component or element that you're working with. It can also provide a complete build plan that helps architect end-to-end solutions, based on an industry vertical. The agent can also run design-time diagnostics to identify gaps and avoid runtime failures.

Accessibility Enhancements in Omnistudio

Build inclusive user interfaces by using the accessibility enhancements in Flexcard and Omniscript elements. These enhancements cover many accessibility requirements, such as enhanced screen reader announcements, easier navigation, and a more powerful UI experience. Some enhancements are only available when you turn on the Accessibility setting in the Flexcard and Omniscript designers. For instance, this setting unlocks new properties for elements such as Radio, Radio Group, Block, and Data Table. Other changes apply even without turning on this setting, such as new custom attributes for icons, autocomplete options in several elements, and so on.

Get Null Values Easily with the New Is Null Operator in Data Mappers

Use the new IS NULL operator in Omnistudio Data Mapper Extract and Turbo Extract to filter null or empty records. Previously, the equality operator (=) didn't consistently handle null filtering, often requiring complex workarounds. For example, to get records with empty account IDs, a Data Mapper operation such as `AccountId = null AND Phone != null` was required. With the IS NULL operator, you can explicitly filter blank fields, without adding an additional condition, such as `!= null`.

Enhance Your Experience Cloud LWR Sites with Flexcards and Omniscripts (Generally Available)

Embed Flexcards and Omniscripts on your Lightning Web Runtime (LWR) Experience Cloud sites, which offer enhanced performance and scalability. To create faster guided interactions for your users, use the combined power of LWR's speed and Omnistudio's customization options. In Spring '26, we removed limitations and provided workarounds where a complete fix isn't available.

Find Omnistudio API Documentation in a New Location

You can now find Omnistudio business APIs, metadata API types, and Apex reference documentation in the Industries Common Resources Developer Guide.

Removal of Hosted Content for Omnistudio for Managed Packages

Some readme files and sample data packs have been removed from Omnistudio for Managed Packages help. We'll let you know if we bring them back.

Omnistudio Minor Releases

Find out about bug fixes, minor updates, and known issues for Omnistudio made after Spring '26 and before Summer '26.

Automate UI Testing for Omniscripts and Flexcards

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Omnistudio now supports comprehensive UI testing for guided experiences and visual components by using the UI Test Automation Model (UTAM) framework. UTAM improves deployment reliability by validating end-to-end workflows. Write UI-driven tests for Omniscripts and Flexcards that validate full user journeys exactly as they appear on screen. UTAM interacts directly with the interface to test user inputs, navigation, actions, data rendering, and visual states.

Where: This change applies to [Aura and LWR sites](#) accessed through Lightning Experience in Enterprise, Performance, and Unlimited editions where Omnistudio is enabled.

Who: This feature is available to Omnistudio customers who use the standard runtime and standard designer.

Why: UTAM offers these key benefits:

- Abstracts Document Object Model (DOM) changes to keep UI tests stable, even when platform updates modify layouts.
- Simulates real user interactions across Omniscripts and Flexcards for end-to-end validation, from data entry to conditional logic.
- Uses Page Object Model (POM) to organize reusable Page Objects (POs), simplifying test creation and maintenance.

How: To use UTAM for automated UI testing, first install and configure your preferred test runner (for example, WebDriverIO or TestNG) to work with the UTAM framework. Next, leverage the Omnistudio UTAM POs to create custom POs for your Omniscripts or Flexcards, abstracting common UI elements, such as steps, inputs, and buttons. Then, build your test scripts on top of these custom POs by using helper methods to launch the Omniscript, set field values, and perform navigation actions. Finally, verify that the end-to-end user journey, validations, and element behaviors work as expected.

[Salesforce Help for Omnistudio: Automated Testing with UTAM for Omnistudio \(can be outdated or unavailable during release preview\)](#)

Get Instant Product Assistance and Troubleshooting with Omnistudio Assistance AI Agent (Pilot)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the Omnistudio Assistance AI pilot agent to get context-aware guidance directly in the designer. Whether you're a designer, developer, or implementation specialist, the agent provides instant, relevant information about any Omnistudio component or element that you're working with. It can also provide a complete build plan that helps architect end-to-end solutions, based on an industry vertical. The agent can also run design-time diagnostics to identify gaps and avoid runtime failures.

Where: This change applies to Lightning Experience, Experience Cloud sites, and all versions of Enterprise, Performance, and Unlimited editions where Omnistudio is enabled. Additionally, you need a Data 360 license with the Agentforce 1 add-ons.

Note Omnistudio Assistance is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

To enable the Omnistudio Assistance AI pilot agent in your org, contact your Account Executive.

Who: This feature is available to Omnistudio customers who use the standard runtime and standard designer. Customers also need the Omnistudio, Data 360, and Agentforce for Industries licenses.

How: After the feature is enabled, from Setup, find and select **Agentforce Agents**. Select **New Agent** and select the **Omnistudio Assistance** template. You can then set up the agent by using the template. In addition, create a permission set. From Setup, find and select **Permission Sets**. Add a new permission set and include Omnistudio Assistance in the Agent Actions section.

Accessibility Enhancements in Omnistudio

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Build inclusive user interfaces by using the accessibility enhancements in Flexcard and Omniscript elements. These enhancements cover many accessibility requirements, such as enhanced screen reader announcements, easier navigation, and a more powerful UI experience. Some enhancements are only available when you turn on the Accessibility setting in the Flexcard and Omniscript designers. For instance, this setting unlocks new properties for elements such as Radio, Radio Group, Block, and Data Table. Other changes apply even without turning on this setting, such as new custom attributes for icons, autocomplete options in several elements, and so on.

Where: This change applies to Lightning Experience, Experience Cloud sites, and all versions of Enterprise, Performance, and Unlimited editions where Omnistudio is enabled.

Who: This feature is available to Omnistudio customers who use the standard runtime. However, changes under the Accessibility toggle apply to Omnistudio customers who use the standard runtime and designer. All changes are available for the SLDS and SLDS+ themes.

Why: These enhancements make your components meet WCAG 2.2 web accessibility standards, helping screen reader and keyboard-only users navigate your applications more effectively. Specific improvements include:

- Improved Semantics: Navigate actions now use real links rather than placeholder links. Screen readers announce when links open in a new window.
- Enhanced Navigation: Keyboard users can now access edit icons in Data Tables on focus. All actions support Space, Enter, and Escape keys.
- Better Visual Feedback: Selected options in Multi-select and Radio elements now display a checkmark for clearer visual indication beyond color alone.

How: To access the optional enhancements, open your Flexcard or Omniscript in the standard designer, select **Setup**, and enable the **Accessibility** toggle.

When you enable the Accessibility setting, these changes become available:

- Radio
 - Improved keyboard navigation
 - Support for new attributes: `role=radiogroup`, `aria-required` and `aria-invalid`
 - Image and color-pick radio buttons now show a visible checkmark when selected.
 - Users can use arrow keys to navigate color-pick options.
- Radio Group
 - The Set All checkbox now behaves correctly at runtime and can't be unchecked once set.
 - When the focus is removed from a specific element, validation is triggered.
 - The DOM structure is updated for better accessibility.
- Block
 - Heading Level: You can now configure the heading level (H1-H6) for blocks to enforce a logical

document structure.

- Delete Confirmation: A confirmation prompt is available when deleting items in a block.

- Data Table

- Row Labels: Meaningful row labels for screen readers are now supported.
- Action Buttons: Action buttons inside the table now have contextual labels.
- Live Updates: Screen readers announce updates to the table content dynamically.
- Keyboard Navigation: Improved navigation for edit icons and sort buttons (focus returns to the sort button after activation).
- Loading Feedback: Screen readers now announce Loading states, for example, when a table is loading or refreshing.

- Typeahead

- An **Edit Icon Label** field is added so you can specify a name for the name of the edit icon. The default remains *Edit*, but you can customize the label as per your preference. This change is specific to the edit mode.
- The option list container's border maintains the minimum contrast ratio of 3:1 with its background color. This change is specific to SLDS Plus theme.
- When the dropdown menu opens, focus is automatically set to the first selectable option. This change is specific to the Lookup mode.

- Action:

- Navigate actions now announce when something opens in a new window.
- Keyboard navigation is enhanced to mirror mouse click behavior.
- New ARIA attributes are added for the Select Cards action. They announce checkbox actions such as selection, de-selection, and so on.

These improvements are available automatically without enabling the Accessibility toggle:

- Set as Disabled Property for Inputs: A new **Set as disabled** property is available for these elements, so that you can explicitly disable them on the pages that they're used on.
 - Currency, Email, Number, Password, Range, Telephone, Text, Text Area, URL, and Lookup.
 - Checkbox: The Read-Only property is replaced by Set as disabled.
 - Multi-select: The Set as disabled property is added.
- Select:
 - The default placeholder "-- No Value --" is changed to "Select a value".
 - Focus remains on the input while typing.
 - Value changes are reflected immediately.
 - The autocomplete input field is added.
- Lookup:
 - With the new **Clear Value** option, you can clear the pre-selected value when the dropdown opens.
 - The autocomplete input field is added.
 - The search icon is removed from the runtime view.
- Icon:
 - Two new custom attributes are added, namely `iconNameLeftAltText` and `iconNameRightAltText`.
- Telephone:

- Visual contrast is improved for better readability.
- Multi-Select:
 - Image multi-select options now display a visible checkmark.

Get Null Values Easily with the New Is Null Operator in Data Mappers

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the new IS NULL operator in OmniStudio Data Mapper Extract and Turbo Extract to filter null or empty records. Previously, the equality operator (=) didn't consistently handle null filtering, often requiring complex workarounds. For example, to get records with empty account IDs, a Data Mapper operation such as `AccountId = null AND Phone != null` was required. With the IS NULL operator, you can explicitly filter blank fields, without adding an additional condition, such as `!= null`.

Where: This change applies to Lightning Experience, Experience Cloud sites, and all versions of Enterprise, Performance, and Unlimited editions where OmniStudio is enabled.

Who: This feature is available to OmniStudio customers who use the standard runtime and standard designer.

Enhance Your Experience Cloud LWR Sites with Flexcards and Omniscripts (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Embed Flexcards and Omniscripts on your Lightning Web Runtime (LWR) Experience Cloud sites, which offer enhanced performance and scalability. To create faster guided interactions for your users, use the combined power of LWR's speed and OmniStudio's customization options. In Spring '26, we removed limitations and provided workarounds where a complete fix isn't available.

Where: This change applies to LWR sites accessed through all versions of Enterprise, Performance, and Unlimited editions where OmniStudio is enabled.

Who: This feature is available to Omnistudio customers who use the standard runtime and standard designer.

How: To add a Flexcard to an LWR site, see the Add a Flexcard to an Experience Builder Page section in the [Activate and Publish a Flexcard](#) topic.

To add an Omniscrypt to an LWR site, see [Add Your Omniscrypt to an Experience Cloud Page](#).

Find Omnistudio API Documentation in a New Location

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now find Omnistudio business APIs, metadata API types, and Apex reference documentation in the Industries Common Resources Developer Guide.

Where: This feature is available to Omnistudio customers.

Find out about bug fixes, minor updates, and known issues for Omnistudio made after Spring '26 and before Summer '26.

Omnistudio Minor Releases

Partner Cloud

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Start managing the full partner lifecycle in one place with tools built directly into Salesforce. Use Partner Cloud to recruit, onboard, enable, and co-sell with partners while giving them secure access to the data and workflows they need. Bring together key capabilities like deal registration, incentives, training, and performance tracking so your team can scale indirect sales and improve partner relationships. Partner Cloud helps you do more with the partners you already have—faster, and with less manual work.

Automate Referral Tracking with B2B Referral Flows

Use the B2B Referral Lead Flow and B2B Referral Opportunity Flow to create referral entities automatically. The flows manage the referral lifecycle, from lead creation and qualification to opportunity closure and reward issuance. When a partner submits a lead, the Lead flow creates referral records and manages status updates as the lead moves from new to qualified. When an opportunity is won, the Opportunity flow updates the referral records and issues the appropriate rewards.

Create and Track Joint Business Plans with Your Partners

A joint business plan, now generally available, helps channel managers and partner reps align on shared goals, KPIs, and actions for a defined planning period. Capture strategic priorities, build measurable objectives, define action plans, and collaborate with partners. This release adds a dedicated joint account plan record type, enhanced objective measure support, Partner Central access, and purpose-built templates for partner planning.

Include Referral Codes in Deal Registrations

Support tracking and reward attribution by giving partners referral codes to submit when they register a deal. The referral code field is captured on both Lead and Opportunity records for visibility across the sales process.

Automate Referral Tracking with B2B Referral Flows

Learn about new features and enhancements for Agentforce Revenue Management.

Revenue Cloud is now Agentforce Revenue Management. You may see references to Revenue Cloud in our application and documentation.

[Discover More Agentforce Revenue Management Features with Salesforce Go](#)

We've made ease-of-use enhancements with Salesforce Go by supporting more features related to Agentforce, Contracts, Document Generation, and Dynamic Revenue Orchestrator.

[Promotions in Agentforce Revenue Management](#)

Pricing designers can set up promotions that users apply to transactions. Developers can use objects and APIs to manage promotions on sales transactions.

[Product Catalog Management](#)

Manage product data in the cache by generating, refreshing, or emptying it, offering flexible options to synchronize data efficiently. Product Catalog Management now supports higher configurable limits for searchable and filterable attributes, which improves product discovery for large catalogs. Users can select more than 20 products during product discovery and add them to a transaction.

[Salesforce Pricing](#)

Define pricing rules across complex, multi-level quotes by using conditional ascending propagation and cross-field horizontal calculations. Simplify pricing logic with conditional IF statements. Accelerate debugging by using auto-numbered steps and element descriptions in the now-renamed Revenue Cloud Operations Console. Improve troubleshooting accuracy with Advanced Price Log Settings and seamlessly deploy entire pricing workflow structures by packaging procedure plans.

[Product Configurator](#)

Deliver clear, localized troubleshooting guidance with full translation support for every run-time message. Complete complex bundle configurations faster by using a streamlined interface to edit attributes and clone product instances directly from component option cards. Improve configuration performance with non-blocking UI behavior for options, and troubleshoot configurations with configuration logs. Access the Configurator API by using a Lightning web component, and use Lightning Message Service events to update fields in a third-party Configurator component.

Transaction Management

Manage complex deal structures easily by creating multiple ramp schedule groups, and amend ramped and nonramped assets in a single transaction. Set up quote line import effortlessly in multicurrency orgs, and automatically populate records related to imported quote lines. Handle transactions easily with advanced filtering, automated and persistent line sorting, and faster instant pricing. Process amendment, renewal, or cancellation transactions before the start date of an existing future-dated order.

Advanced Approvals

As an approval designer, use custom flow logic to auto-approve resubmitted records. Approve high-value record requests faster by overriding approval conditions easily. Enhance your smart approval logic by configuring step conditions with eight additional data types and up to 30 conditions for approval stage and step criteria. Create detailed approval email templates for up to 8 different notification reasons, giving reviewers all the necessary context to act on the request directly from their email.

Dynamic Revenue Orchestrator

Extend orchestration capabilities to any business transaction. Insert custom logic between decomposition and plan generation to derive and update fulfillment data. Prevent callout step failures as they are paused during external system downtime. Migrate rules efficiently between Salesforce orgs. Use Decomposition Workspace for better clarity and graphical rule design for Enterprise Price Catalog products. Orchestrate Industries Configure, Price, Quote orders through direct integration with Enterprise Price Catalog and orchestrate move and change of plan orders.

Usage Management

Improve the efficiency of your usage model by streamlining product setup using validation tools and automating asset creation for complex usage products. Enhance pricing consistency and accuracy through rate capture, proactively monitor daily usage and overages to mitigate unexpected charges, and expand real-time visibility into customer wallet balances within Experience Cloud sites.

Billing

Maintain accurate billing, reduce manual effort, and strengthen a reliable quote-to-cash process. Keep billing precise during complex updates and simplify customer inquiry with end-to-end dispute resolution process. Allocate shared charges across all parties and maintain consistent, audit-ready records. Streamline tax reporting with enhanced regional identifiers and product details. Manage payment adjustments easily and define custom rules to retry failed payments. Buyers can save their preferred payment methods for faster checkout.

Salesforce Contracts

Contract authors and template designers have greater control over how they structure, style, and review contract content. Improvements to section behavior, clause formatting, and profile-based access help maintain consistent layouts, protect sensitive content, and make sure that the intended users participate in internal reviews. Expanded reconciliation and token capabilities keep data

accurate across contracts, line items, and related records. Large and complex documents are more responsive during editing, comparison, and check-in. Document Template migration improvements further preserve document structure and clause relationships as they move between Salesforce orgs.

Salesforce Document Generation

Generate clearer documents with precise data by applying data filters, transformation logic, and richer token coverage. These updates help make sure that structured content, nested values, and line item details are present accurately. Generate large documents more efficiently, even when they include substantial content or complex formatting. Achieve consistent in-browser previews by using the hybrid file handling setting. Remove interim previews in Omniscripts to keep only the final version and reduce storage use.

Agentforce for Revenue Management

Support partner quoting with rule-based product recommendations and expand billing data access for internal teams. Improve invoice charge explanations for community users. Identify token over-consumption with automated generation of targeted token pack quotes.

Promotions in Agentforce Revenue Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Pricing designers can set up promotions that users apply to transactions. Developers can use objects and APIs to manage promotions on sales transactions.

Increase Sales and Influence Purchasing Decisions by Using Promotions in Agentforce Revenue Management

Empower pricing designers to create manual and automatic promotions that offer discounts on products and categories. Designers define promotion eligibility based on rules and sales channels, and specify how to evaluate multiple applied promotions. Show your users, such as sales reps, partners, and customers, these promotions when they browse products and catalogs. Apply automatic promotions to lines when users add products to transactions. Users can apply manual promotions when they configure products and manage lines. They can see applied discounts in the price waterfall and the applied promotions on assets. They can also apply promotions when they amend or renew assets.

New and Changed Objects for Promotions in Agentforce Revenue Management

Store and access promotion-related data with these new objects and changes to existing Agentforce Revenue Management, formerly Revenue Cloud, objects.

New Connect REST API for Promotions

Simplify the sales workflow by verifying and applying discounts accurately by using details of eligible promotions.

Increase Sales and Influence Purchasing Decisions by Using Promotions in Agentforce Revenue Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Empower pricing designers to create manual and automatic promotions that offer discounts on products and categories. Designers define promotion eligibility based on rules and sales channels, and specify how to evaluate multiple applied promotions. Show your users, such as sales reps, partners, and customers, these promotions when they browse products and catalogs. Apply automatic promotions to lines when users add products to transactions. Users can apply manual promotions when they configure products and manage lines. They can see applied discounts in the price waterfall and the applied promotions on assets. They can also apply promotions when they amend or renew assets.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and

Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license, and the Global Promotions Management Basic Add On license. To purchase the add-on, contact your Salesforce account executive.

Who: To see and apply promotions, users need the Apply Promotions on Sales Transactions permission set.

Why: Let's say a company, QuantumBit, wants to drive longer contracts and secure a predictable, recurring revenue stream by using promotions.

Pricing designers provide a 10% discount on a bundled product, QuantumBit Complete Solution, when users buy the product with an annual subscription. They also provide an additional 20% discount on an optional child product, QuantumBit Essentials Training, when customers buy it as part of the bundle.

Configure Promotion Template [View Summary](#)

Get Discount + Rewards on X (Based on Selling Model)

*Priority 1

*Rule Name QBCS_BundleDiscount

What Customers Get

QuantumBit Complete Solution

1 For Term Annual selling model, Percentage Off is 10%

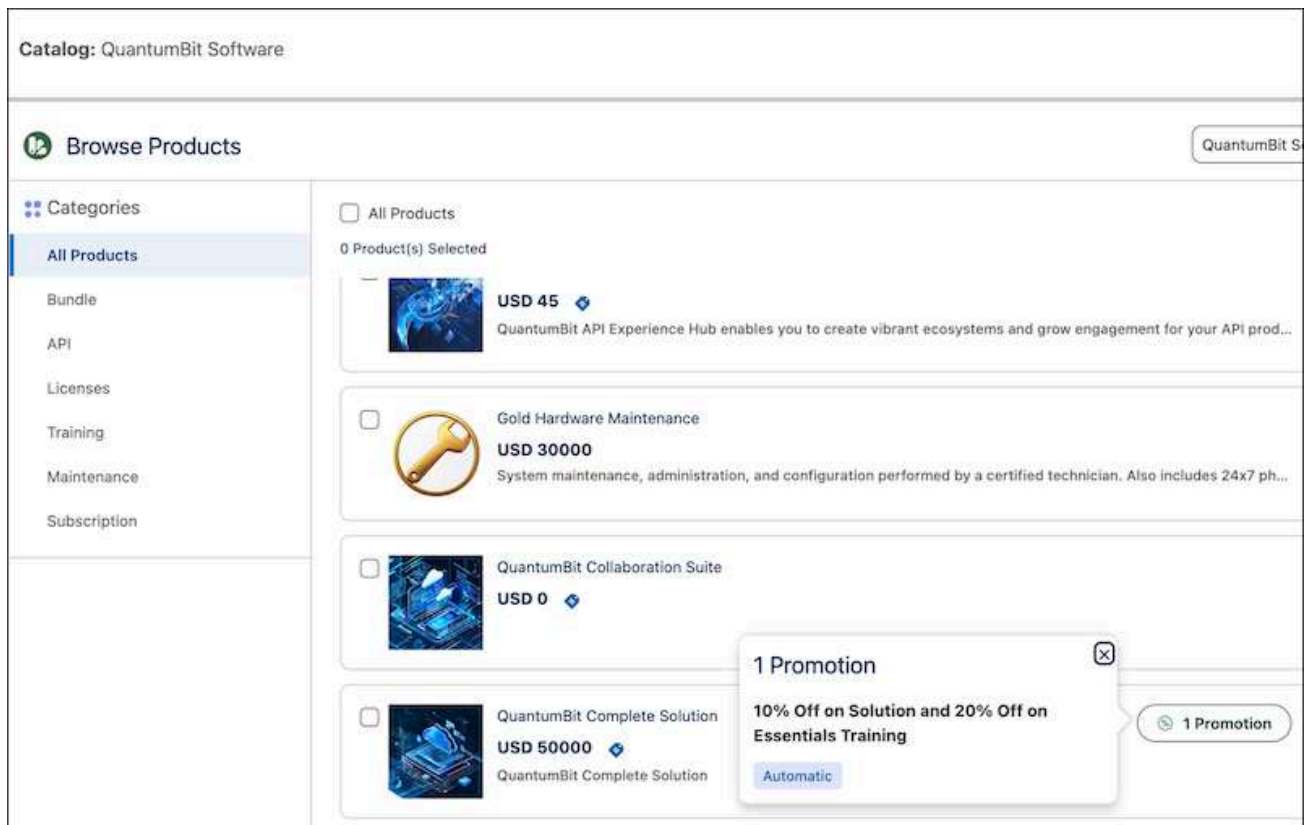

QuantumBit Essentials Training

1 For One-Time selling model, Percentage Off is 20%

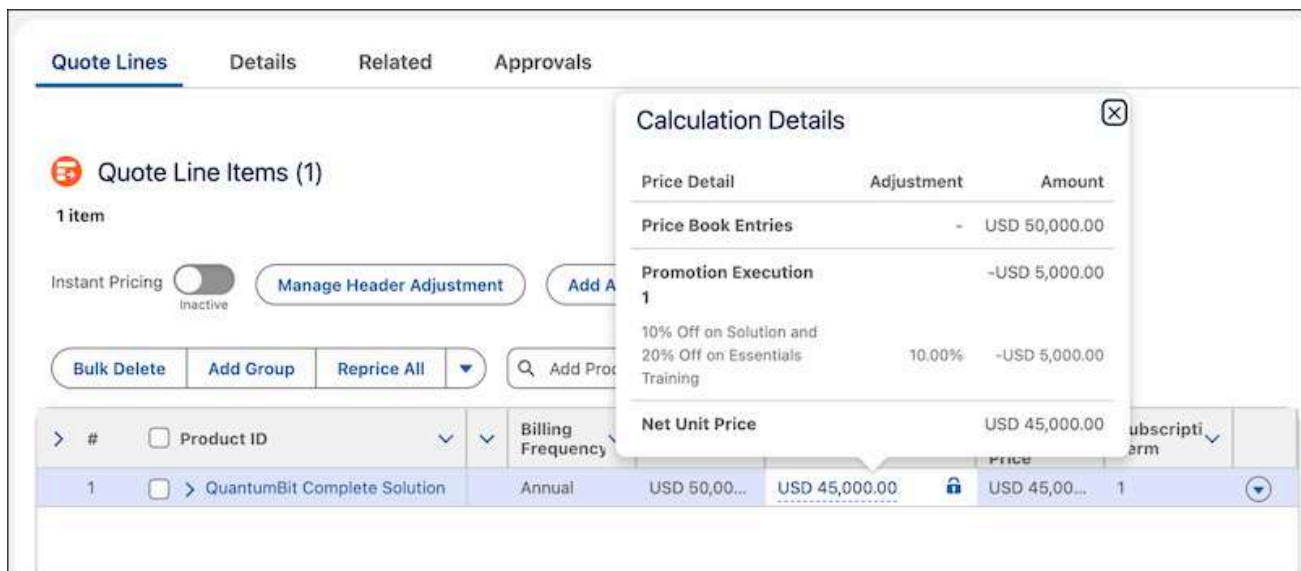

+ Add Child Product Or Category

Previous Save Draft Cancel Next

When users browse and add the products, they see the eligible promotions. These promotions influence customers toward longer subscriptions of the bundled product and encourage purchases of the child product's subscriptions.

After applying promotions, users see the applied discounts in the price waterfall to understand the price breakdown.

New and Changed Objects for Promotions in Agentforce Revenue Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Store and access promotion-related data with these new objects and changes to existing Agentforce Revenue Management, formerly Revenue Cloud, objects.

Create a junction between an asset and a promotion that's applied to the asset

Use the new `AssetActionSrcPriceAdjustment` object.

Specify the date and time when a promotion is applied to an order item

Use the `AppliedPromotionDate` field on the existing `OrderItemAdjustmentLineItem` object.

Specify the coupon code to apply a manual promotion to an order item

Use the `CouponCode` field on the existing `OrderItemAdjustmentLineItem` object.

Specify the date and time when a promotion is applied to a quote line

Use the `AppliedPromotionDate` field on the existing `QuoteLinePriceAdjustment` object.

Specify the coupon code to apply a manual promotion to a quote line

Use the `CouponCode` field on the existing `QuoteLinePriceAdjustment` object.

New Connect REST API for Promotions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Simplify the sales workflow by verifying and applying discounts accurately by using details of eligible promotions.

Retrieve eligible promotions for specific line items within a quote or an order

Make a POST request to the `/revenue/transaction-management/sales-transactions/actions/get-eligible-promotions` resource.

New request body: Get Promotions Info Input

New response body: Eligible Promotions List

See Also

[Revenue Cloud Developer Guide: Get Eligible Promotions \(POST\)](#)

Product Catalog Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage product data in the cache by generating, refreshing, or emptying it, offering flexible options to synchronize data efficiently. Product Catalog Management now supports higher configurable limits for searchable and filterable attributes, which improves product discovery for large catalogs. Users can select more than 20 products during product discovery and add them to a transaction.

Simplified Product Data Cache Refresh

You can now easily manage product data in the cache by generating the cache for all products, refreshing existing products, or emptying the entire cache. This enhancement provides flexible, controlled options to synchronize your data. You can choose the action that best meets your cache management requirements for maximum efficiency. End-users benefit from optimal loading times and access to the latest product details via the Product Detail API.

Find Products Faster in Large Catalogs with Increased Search Limits

Product Catalog Management now supports higher configurable limits for searchable and filterable attributes and fields. This enhancement helps customers with large product catalogs to improve product discovery using more flexible search criteria.

Select More Products During Product Discovery

Select more than 20 products during product discovery and add them to a transaction. The updated Bulk Product Details API now retrieves comprehensive details for a greater number of products simultaneously. This change benefits customers who frequently select multiple products from a category, leading to faster and more efficient transactions.

New and Changed Connect REST APIs in Product Catalog Management

Specify Enterprise Product Catalog (EPC) as a catalog source, and extend Product Details API to support your unique custom fields and objects. You can also get product classification details for EPC with the new API enhancements.

Simplified Product Data Cache Refresh

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth, Revenue Cloud Advanced, or Revenue Cloud Billing license.

How: To increase the limit, update the orgValue MaxIdsInBulkProductDetails.

New and Changed Connect REST APIs in Product Catalog Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Specify Enterprise Product Catalog (EPC) as a catalog source, and extend Product Details API to support your unique custom fields and objects. You can also get product classification details for EPC with the new API enhancements.

Get product classification details for EPC

Make a POST request to the `/revenue/product-catalog-management/product-classifications/details` resource by specifying the `catalogSystems` input property value as `epc`.

New request body: Product Classification Details Input

New response body: Product Classification Details Collection

Specify the name of the catalog system to retrieve product details for a specified product ID

Make a GET request to the `/connect/pcm/products/productId` resource.

New request parameter: `catalogSystems`. Specify either `epc` or `pcm` as the value.

Changed Connect REST API Request Bodies

Bulk Product Details Input

This request body has this new property.

`catalogSystems` –Name of the catalog system to retrieve the details for specified product IDs.

You can specify either `epc` or `pcm` as the value.

Product Details Input

Improve product data accuracy and customization through partial-period usage details for different product configurations. Get the proration policy details for each product selling model option by specifying the details in Product Details API's `additionalFields` property.

Salesforce Pricing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Define pricing rules across complex, multi-level quotes by using conditional ascending propagation and cross-field horizontal calculations. Simplify pricing logic with conditional IF statements. Accelerate debugging by using auto-numbered steps and element descriptions in the now-renamed Revenue Cloud Operations Console. Improve troubleshooting accuracy with Advanced Price Log Settings and seamlessly deploy entire pricing workflow structures by packaging procedure plans.

Streamline Complex Quote Calculations with Smarter Price Propagation

Manage complex, multi-level quotes by defining formulas that calculate and propagate discounts and totals throughout the quote hierarchy. Simplify pricing configuration for complex quote structures with up to 5 levels of nesting. Build consistent pricing flows by using ascending propagation to conditionally roll up totals and discounts to the parent level. Use horizontal calculations to compute values based on other fields within the same quote line or group.

Package Your Pricing Workflow Seamlessly

Migrate entire pricing solutions across Salesforce orgs by adding procedure plans directly to your deployment package. Transfer the complete execution flow of pricing and discovery procedures to reduce manual setup effort. Deploy your validated pricing workflow with speed and accuracy to ensure immediate consistency in every target org.

Troubleshoot Pricing Elements with Advanced Price Log Settings

Use Advanced Price Log Settings to collect detailed diagnostic data for complex pricing elements. The logs capture input values and complete exception details for elements such as Attribute-Based Price, Derived Price, and other logic-heavy elements. This framework streamlines troubleshooting and performance analysis so that admins can identify the root cause of issues.

Build Pricing Logic with Conditional IF Statements

Solve complex pricing scenarios by using conditional IF statements and nested logic directly within the Formula-Based Pricing element. Pricing designers can now replicate complex business logic, such as intricate calculations for product pricing by using basis points or advanced logic for promotional discounts, without relying on custom code. This enhancement optimizes procedure readability and accelerates debugging.

Accelerate Debugging of Pricing Flows

Use auto-numbered steps and element descriptions in a pricing procedure to improve readability and provide a clear visual map of the execution path in the Pricing Operations Console. The numbering automatically adjusts when elements are added or moved, reducing manual effort and supporting faster, more accurate troubleshooting across pricing procedures.

Pricing Operations Console Is Now Revenue Cloud Operations Console

To better align with the data it presents, the Pricing Operations Console is now renamed to Revenue Cloud Operations Console. This change does not affect the console's functionality or user experience. Product documentation and in-app terminology have been updated to reflect this change.

Streamline Complex Quote Calculations with Smarter Price Propagation

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Package Your Pricing Workflow Seamlessly

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Migrate entire pricing solutions across Salesforce orgs by adding procedure plans directly to your deployment package. Transfer the complete execution flow of pricing and discovery procedures to reduce manual setup effort. Deploy your validated pricing workflow with speed and accuracy to ensure immediate consistency in every target org.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

See Also

[Salesforce Help: Export and Import Procedure Plans \(can be outdated or unavailable during release preview\)](#)

Troubleshoot Pricing Elements with Advanced Price Log Settings

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Advanced Price Log Settings to collect detailed diagnostic data for complex pricing elements. The logs capture input values and complete exception details for elements such as Attribute-Based Price, Derived Price, and other logic-heavy elements. This framework streamlines troubleshooting and performance analysis so that admins can identify the root cause of issues.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

How: From Setup, in the Quick Find box, enter *Salesforce Pricing*, and then select **Advanced Price Log Settings**. Turn on advanced logs for the elements that you want to debug.

[Salesforce Help: Advanced Price Log Settings \(can be outdated or unavailable during release preview\)](#)

Build Pricing Logic with Conditional IF Statements

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Solve complex pricing scenarios by using conditional IF statements and nested logic directly within the Formula-Based Pricing element. Pricing designers can now replicate complex business logic, such as intricate calculations for product pricing by using basis points or advanced logic for promotional discounts, without relying on custom code. This enhancement optimizes procedure readability and accelerates debugging.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Accelerate Debugging of Pricing Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use auto-numbered steps and element descriptions in a pricing procedure to improve readability and provide a clear visual map of the execution path in the Pricing Operations Console. The numbering automatically adjusts when elements are added or moved, reducing manual effort and supporting faster, more accurate troubleshooting across pricing procedures.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Pricing Operations Console Is Now Revenue Cloud Operations Console

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To better align with the data it presents, the Pricing Operations Console is now renamed to Revenue

Cloud Operations Console. This change does not affect the console's functionality or user experience. Product documentation and in-app terminology have been updated to reflect this change.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Product Configurator

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Deliver clear, localized troubleshooting guidance with full translation support for every run-time message. Complete complex bundle configurations faster by using a streamlined interface to edit attributes and clone product instances directly from component option cards. Improve configuration performance with non-blocking UI behavior for options, and troubleshoot configurations with configuration logs. Access the Configurator API by using a Lightning web component, and use Lightning Message Service events to update fields in a third-party Configurator component.

[Accelerate Troubleshooting for Global Teams with Translation Support for Run-Time Messages](#)

Provide your sales reps with localized messages for warnings, errors, or other information in the Configurator. Set up custom labels from Constraint Builder for translating all run-time messages defined within a constraint model. Use bulk label generation to accelerate the label setup. Reuse existing labels easily with autocomplete options in CML Editor and Visual Builder. Boost adoption and reduce confusion with the capability to define clear, understandable messages in local languages for troubleshooting and guidance.

[Improve Usability with a More Flexible and Intuitive Configurator Interface](#)

Sales reps can gain better control of their product configurations with a more streamlined Configurator interface. Make informed decisions faster by viewing, comparing, and editing product attributes and context fields directly on the component option cards. Easily add multiple instances of a dynamic product or clone product instances with their current configurations. These enhancements, providing flexibility and a more consolidated view, help sales reps complete bundle configurations faster with fewer clicks and less scrolling.

[Enable Non-Blocking UI Behavior for Attributes and Options](#)

With non-blocking UI behavior for attributes and options, you can change multiple values on a product without waiting for system response, to speed up the configuration process. After the changes

load, actions including Save, Save and Exit, Cancel, and Update Prices are available.

Use Configuration Logs to Debug Configurations

Generate and review configuration logs to analyze configuration behavior and address inefficiencies. Use the configuration logs to make sure that your configurations perform as expected.

Access Configurator API More Easily by Using a Lightning Web Component

Use a wire adapter with a Lightning web component to access Configurator API. The wire adapter simplifies the process for fetching data, compared to using Connect API. Use Configurator API to build a custom configurator UI and incorporate existing first-party configurator UI components as needed.

Update Sales Transaction Fields in a Third-Party Configurator UI

Use Lightning Message Service (LMS) events to update all fields on a sales transaction item, including custom fields, for a third-party configurator UI components. With the increased flexibility, third-party components can easily communicate with Data Manager in the product configurator flow.

Updates in Default Product Configurator Flow

The Default Product Configurator flow has new attributes. If you've cloned the Default Product Configurator flow before Spring '26, manually map the new attributes in your customized flow, or clone the default flow and apply your customizations again.

Accelerate Troubleshooting for Global Teams with Translation Support for Run-Time Messages

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Provide your sales reps with localized messages for warnings, errors, or other information in the Configurator. Set up custom labels from Constraint Builder for translating all run-time messages defined within a constraint model. Use bulk label generation to accelerate the label setup. Reuse existing labels easily with autocomplete options in CML Editor and Visual Builder. Boost adoption and reduce confusion with the capability to define clear, understandable messages in local languages for troubleshooting and guidance.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Who: To create and manage custom labels, you need the Customize Application user permission.

How: To define a unique custom label for each run-time message you want to translate, in Constraint Builder, click **Add Labels**. The custom labels replace the message text in your CML code. Manage all future changes to these labels from the Custom Labels page in Setup.

Improve Usability with a More Flexible and Intuitive Configurator Interface

This release is in preview

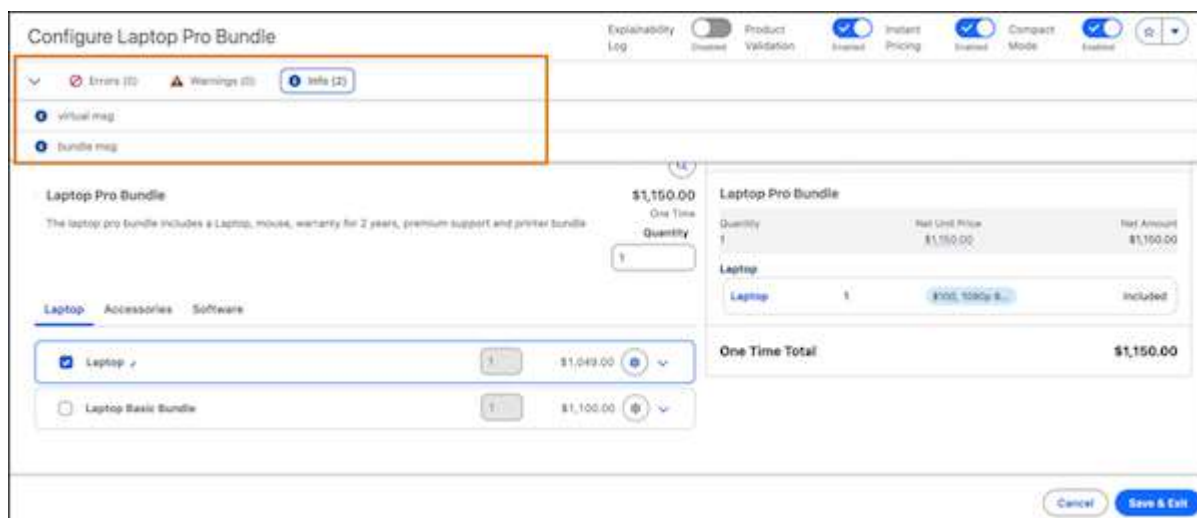

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Sales reps can gain better control of their product configurations with a more streamlined Configurator interface. Make informed decisions faster by viewing, comparing, and editing product attributes and context fields directly on the component option cards. Easily add multiple instances of a dynamic product or clone product instances with their current configurations. These enhancements, providing flexibility and a more consolidated view, help sales reps complete bundle configurations faster with fewer clicks and less scrolling.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Why: Additionally, in the Configurator interface, you can now:

- Review errors and warnings in a persistent error component that remains visible as you scroll.
- See more information at a glance with a denser compact layout that reduces whitespace. For consistency, the new layout prioritizes fixed positioning for these key fields: Product Name, Quantity, Product Selling Model, and Net Price. Any custom fields added will be visible upon expanding the option card.

How: For accounts using a custom Configurator flow, admins are required to manually assign values for:

- The Messages and Messages in Fixed Position variables to enable and fix the message component in position.
- The Display Option Card Attributes and Option Card Attributes Limit variables to control the display of attributes on the product option cards.
- The Price Total Summary Section Visibility variable to determine whether to show the price totals section in the Summary component.

Updates in Default Product Configurator Flow

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Default Product Configurator flow has new attributes. If you've cloned the Default Product Configurator flow before Spring '26, manually map the new attributes in your customized flow, or clone the default flow and apply your customizations again.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Why: Update your Configurator flow with the latest attributes so that new features work as expected and you get a seamless configuration experience.

The ID of the transaction context for which the Configurator is launched

Use the new **Transaction Context ID** attribute of the Input type on the Product Configurator Data Manager flow component.

A boolean value that indicates whether to display the product attributes within the option card

Use the new **Display Option Card Attributes** attribute of the Input type on the Product Configurator Option Groups flow component.

The number of product attributes to be displayed within the option card

Use the new **Option Card Attributes Limit** attribute of the Input type on the Product Configurator Option Groups flow component.

A collection of Apex ProductConfig__Promotions records that contain the promotions eligible for the product

Use the new **Eligible Promotions** attribute. It's of Input type on the Product Configurator Summary flow component and of Output type on the Product Configurator Data Manager flow component.

A boolean value that indicates whether the messages component is fixed in position when scrolling

Use the new **Messages in Fixed Position** attribute. It's of both Input and Output types on the Product Configurator Data Manager flow component, and of Input type on the Product Configurator Messages, Product Configurator Transaction Header, and Product Configurator Summary flow components.

A collection of Apex ProductConfig__Message records that contain alerts, warnings, and errors encountered by the component

Use the new **Messages** attribute of the Input type on the Product Configurator Transaction Header and Product Configurator Summary flow components.

A boolean value that indicates whether the section displaying price totals in the Summary component is shown at run time

Use the new **Price Total Summary Section Visibility** attribute. It's of Input type on the Product Configurator Summary flow component and of Output type on the Product Configurator Data Manager flow component.

Transaction Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage complex deal structures easily by creating multiple ramp schedule groups, and amend ramped and nonramped assets in a single transaction. Set up quote line import effortlessly in multicurrency orgs, and automatically populate records related to imported quote lines. Handle transactions easily with advanced filtering, automated and persistent line sorting, and faster instant pricing. Process amendment, renewal, or cancellation transactions before the start date of an existing future-dated order.

Autopopulate Default Child Lines and Attributes During Quote Line Import

Speed up quoting and improve accuracy by using the new Data Processing Engine definition to autopopulate default records related to imported quote lines. When users import quote lines from CSV files, the import process populates default child lines for bundled products, and default quote line item attributes and their values. Users can also import static product bundles and products with static attributes.

Set Up Quote Line Import Easily When Multiple Currencies Are Enabled

Quickly configure quote line imports by using the new prebuilt Data Processing Engine definition template when your Salesforce org uses multiple currencies. This template reduces the manual setup steps previously required to add and map currency fields.

Manage Complex Deals and Amendments by Using Multiple Ramp Schedule Groups

Enable your users to create and manage multiple, independent ramp schedule groups on a single quote or order to handle complex deal structures. Users can also amend non-ramped and ramped assets—including ramped assets with different asset state period dates—in a single transaction. Sales reps can perform complex actions, such as “rip and replace,” to remove assets and add new ones in a single transaction.

Enrich Navigation by Using Advanced Filtering

Your sales reps and partners can now filter all quote and order lines including ramped lines, errored lines, and unconfigured lines by using predefined filters. They can also create advanced filters to target specific fields, operators, and values. They can manage complex transactions easily by applying filters across all groups or selected groups.

Automate Consistent Line Item Sequencing on Quotes and Orders (Pilot)

Sales reps can control how line items show up on quotes and orders by introducing an automated and persistent sort order. Line items now appear in the sequence in which they're added. Automatic Line Item Sequencing (pilot) maintains item order when converting a quote to an order, and resolves the unpredictable item order shuffling that previously occurred in processing. Sales reps can also manually reorder items, providing the reliable sequencing needed to adjust the order of items to meet specific business needs.

Update Prices Faster by Using Instant Pricing

Recalculate only the lines that have price-impacting changes on your quotes and orders. Give your sales reps faster and more accurate pricing results when they edit complex transactions.

Show Precise Discounts in the Price Waterfall

Show your sales reps discount percentages and amount adjustments in the price waterfall with the correct decimal precision. Percentage discounts show up to two decimal places, and amount adjustments follow the currency scale. Help sales reps understand discount values accurately and remove the confusion caused by rounded percentages.

Speed Up Processing of Quotes and Orders with Context Reuse

By preventing services from unnecessarily recreating context instances, this feature reduces wasted

resources, boosts efficiency, and prevents issues like stale data and race conditions. The context reuse feature improves the performance and responsiveness of Agentforce Revenue Management transactions by enabling components to share context. When sales reps handle quotes and orders, edits work smoothly, and data is uniform and up to date across all transaction editing workflows.

Track Product Swap, Upgrade, and Downgrade Amendments

Make sure that transactions are transparent and accurately track the intent of every sale change. Agentforce Revenue Management now natively supports Swaps, Upgrades, and Downgrades as distinct amendment types, which boosts the efficiency of your sales reps. New connections among the related quote line items, order items, and asset actions make sure that these transactions are recognizable and auditable. Sales reps save time and effort used in the previous method that simply recorded them as a cancellation and new product sale.

Modify Upcoming Orders with Future-Dated Amendments

Edit any order that has a future start date to reflect customer-requested changes. Save sales reps time and effort used in the previous method that recorded the changes as a cancellation and new product sale. Your sales team can now perform all transaction amendment types, including adding, swapping, upgrades, or product quantity changes to orders with future start dates. Keep customer orders up-to-date and accurate.

Restrict User Access to Sensitive Data When Pricing Quotes and Orders

Give your users the ability to price quotes and orders even when they don't have access to underlying sensitive data required for pricing. Enhance security and limit the access to sensitive data, such as product costs.

Save Time by Setting Instant Pricing to Active by Default

Instant Pricing provides users the ability to recalculate prices immediately when they edit a line, instead of only upon saving the transaction. Simplify transaction management by turning on Instant Pricing by default on quote and order pages. Users can turn off Instant Pricing if needed.

Changed Object in Transaction Management

Do more with the changed UserUIPreference object in Transaction Management.

New Connect REST API in Transaction Management

Enable troubleshooting and improve the reliability of transaction processing.

New and Changed Invocable Actions in Transaction Management

Get flexible and granular control over grouped asset pricing during renewal. Also, streamline the process of replacing existing assets.

Changed Tooling API Object in Transaction Management

Gain more control over rate synchronization and ensure pricing consistency across transactions.

Autopopulate Default Child Lines and Attributes During Quote Line Import

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

Speed up quoting and improve accuracy by using the new Data Processing Engine definition to autopopulate default records related to imported quote lines. When users import quote lines from CSV files, the import process populates default child lines for bundled products, and default quote line item attributes and their values. Users can also import static product bundles and products with static attributes.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Why: This enhancement makes sure that quotes have the default product configuration after import. When users import quote line items from CSV files, the Data Processing Engine definition creates these records.

- Quote lines for all the child products in the hierarchy that have **Include component by default** selected. See [Product Relationship Management in Revenue Cloud](#).
- Related attributes that have **Default Value** selected. See [Configure Product Attributes in Revenue Cloud](#).

How: Clone the latest version of the Create Quote Line Items from a CSV File Data Processing Engine template. Then, on the Revenue Settings page, for Data Processing Engine Definition for Importing Quote Line Items, select your definition.

Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make sure that transactions are transparent and accurately track the intent of every sale change. Agentforce Revenue Management now natively supports Swaps, Upgrades, and Downgrades as distinct amendment types, which boosts the efficiency of your sales reps. New connections among the related quote line items, order items, and asset actions make sure that these transactions are recognizable and auditable. Sales reps save time and effort used in the previous method that simply recorded them as a cancellation and new product sale.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Who: To process product swaps, upgrades, and downgrades, users need the Amend Assets user permission.

Modify Upcoming Orders with Future-Dated Amendments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Edit any order that has a future start date to reflect customer-requested changes. Save sales reps time and effort used in the previous method that recorded the changes as a cancellation and new product sale. Your sales team can now perform all transaction amendment types, including adding, swapping, upgrades, or product quantity changes to orders with future start dates. Keep customer orders up-to-date and accurate.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

Who: To modify future-dated orders, users need the Amend Assets user permission.

How: Sales reps can go to the order page, select a future-date order, and make the necessary changes.

Restrict User Access to Sensitive Data When Pricing Quotes and Orders

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your users the ability to price quotes and orders even when they don't have access to underlying sensitive data required for pricing. Enhance security and limit the access to sensitive data, such as product costs.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or the Revenue Cloud Advanced license.

How: In Setup, find and select **Revenue Settings**. Turn on **Elevated Data Access for Pricing Quotes and Orders**. Then, set restrictive field and object permissions for users.

Advanced Approvals

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

As an approval designer, use custom flow logic to auto-approve resubmitted records. Approve high-value record requests faster by overriding approval conditions easily. Enhance your smart approval logic by configuring step conditions with eight additional data types and up to 30 conditions for approval stage and step criteria. Create detailed approval email templates for up to 8 different notification reasons, giving reviewers all the necessary context to act on the request directly from their email.

Approve Resubmissions Faster by Using Custom Logic

Approval designers can now implement custom logic for auto-approving resubmitted records, overriding smart approval conditions. Make sure that urgent, high-value records move quickly through the approval process. Approval designers can create a custom flow to evaluate any necessary criteria, including checks against the prior submission details. Simplify this verification by using the new `Get Previous Related Record Details` invocable action within the flow to easily capture the previously submitted record's details. The new `Use Custom Auto Approval Logic` field on the approval step then stores the custom flow's decision value to determine if the step is auto-approved.

Improve Approval Reviews with Custom Email Templates for Key Approval Paths

Give approval designers the ability to use Lightning or Visualforce email templates. Designers can associate these templates with specific approval steps or the entire workflow. They can configure these templates for up to 8 different notification reasons that are relevant to approval submitters and reviewers. Previously, the custom email templates configured within the approval workflow lacked advanced formatting capabilities and didn't support custom submitter emails. Use the new templates to show complex record data in structured formats, such as tables and images, so that your approval reviewers have all the necessary context to act on the requests directly from their email.

Process Smart Approvals Faster by Skipping Condition Checks

Give approval designers the option to skip the evaluation of the entry conditions in an approval step within a smart approval process. Help them save approval processing time by skipping unnecessary condition checks from resubmission evaluation based on your workflow's context. For instance, if the submitted record description is empty during resubmission, designers can skip the condition if it's

irrelevant to the evaluation.

Define Complex Smart Approval Logic with More Data Types

Configure the approval step entry conditions in an approval workflow by using nine additional data types, such as Date Time, Boolean, and Currency. Previously, you could define conditions for only the Text and Number data types. Help approval designers build complex and precise smart approval logic that aligns closely with your business rules, and reduce manual review time. For example, set a Date step entry condition that requires an approval step during resubmission only if the resubmission date is after a certain date.

Manage Complex Workflows Easily by Adding More Conditions

Define up to 30 conditions for an approval stage exit, approval step entry, and approval step exit in an approval workflow. Previously, you defined a maximum of 10 conditions. Give approval designers the flexibility to build workflows that manage complex approval requests and minimize manual reviews for their users.

New and Changed Objects for Advanced Approvals

Store and access more data with these new Advanced Approvals objects and changes to existing Advanced Approvals objects.

Approve Resubmissions Faster by Using Custom Logic

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Approval designers can now implement custom logic for auto-approving resubmitted records, overriding smart approval conditions. Make sure that urgent, high-value records move quickly through the approval process. Approval designers can create a custom flow to evaluate any necessary criteria, including checks against the prior submission details. Simplify this verification by using the new Get Previous Related Record Details invocable action within the flow to easily capture the previously submitted record's details. The new Use Custom Auto Approval Logic field on the approval step then stores the custom flow's decision value to determine if the step is auto-approved.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or Revenue Cloud Advanced license where Advanced Approvals is enabled.

Who: To edit an approval workflow, you need the Manage Flow user permission.

How: From Setup, in the Quick Find box, find and select **Flows**. Open an Advanced Approvals flow.

- Create a custom flow in a background step.
- Open an approval step. On the step's properties tab, select **Set custom logic for auto-approvals**, and

specify the decision value of your custom flow in the Auto-Approve Step field.

Improve Approval Reviews with Custom Email Templates for Key Approval Paths

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give approval designers the ability to use Lightning or Visualforce email templates. Designers can associate these templates with specific approval steps or the entire workflow. They can configure these templates for up to 8 different notification reasons that are relevant to approval submitters and reviewers. Previously, the custom email templates configured within the approval workflow lacked advanced formatting capabilities and didn't support custom submitter emails. Use the new templates to show complex record data in structured formats, such as tables and images, so that your approval reviewers have all the necessary context to act on the requests directly from their email.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or Revenue Cloud Advanced license where Advanced Approvals is enabled.

Who: To create and update email templates, you need the relevant [email template permissions](#). To create approval alert content definition records, you need the Approval Admin, Approval Designer, or the Modify All Data user permission.

Why: Approval designers can use the email templates to notify the approval reviewers about key updates, such as approval step assignment and auto-approval confirmation. Similarly, notify the approval submitters about updates such as the creation of their approval submission and the approval or rejection of their submission.

Process Smart Approvals Faster by Skipping Condition Checks

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give approval designers the option to skip the evaluation of the entry conditions in an approval step within a smart approval process. Help them save approval processing time by skipping unnecessary

condition checks from resubmission evaluation based on your workflow's context. For instance, if the submitted record description is empty during resubmission, designers can skip the condition if it's irrelevant to the evaluation.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Growth or Revenue Cloud Advanced license where Advanced Approvals is enabled.

Who: To skip conditions from smart approval evaluation in an approval workflow, you need the Manage Flow user permission.

How: From Setup, in the Quick Find box, find and select **Flows**. Open the flow that has Smart Approvals turned on, and then open the approval step's Properties tab. In the Smart Approval Skip Conditions field, enter the sequence numbers of the entry conditions that you want to skip from smart approval evaluation, separated by commas.

Define Complex Smart Approval Logic with More Data Types

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. New and Changed Objects for Advanced Approvals

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Store and access more data with these new Advanced Approvals objects and changes to existing Advanced Approvals objects.

Store the mapping that links specific user-created email templates to different notification events within a workflow

Use the new `ApprovalAlertContentDef` object.

Manage the notification systems asynchronously for a workflow

Use the new `AppvlWorkItemNtfcnEvent` object.

Specify whether custom logic automatically approves an approval work item in a workflow

Use the new `DoesUseCustomAutoAppvlLogic` field on the existing `ApprovalWorkItem` object.

Specify whether a condition should be skipped in the auto-approval evaluation

Use the new `IsExcludedFromAutoApproval` field on the existing `ApprovalWorkItemCondition` object.

Dynamic Revenue Orchestrator

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Extend orchestration capabilities to any business transaction. Insert custom logic between decomposition and plan generation to derive and update fulfillment data. Prevent callout step failures as they are paused during external system downtime. Migrate rules efficiently between Salesforce orgs. Use Decomposition Workspace for better clarity and graphical rule design for Enterprise Price Catalog products. Orchestrate Industries Configure, Price, Quote orders through direct integration with Enterprise Price Catalog and orchestrate move and change of plan orders.

Extend Orchestration to All Business Transaction Types

Design and run orchestration for any business process with the usage type framework. Bring your own context definition and automate new business processes for non-sales transactions. For example, automate the Dunning process using the Collections Plan object. Dynamic Revenue Orchestrator (DRO) further automates generation of a generic, product-independent plans for orders.

Plug Custom Logic Between Decomposition and Plan Generation

Insert custom logic to update the fulfillment order line item data between the order decomposition and plan generation processes. Gain greater control over the fulfillment process and align your order data with specific fulfillment requirements to craft a more efficient plan. Use the individual invocable actions to run decomposition and orchestration as separate processes independent of each other.

Design Decomposition Rules Seamlessly by Using the Enhanced Workspace

View the product class-based decomposition rules inherited by a product alongside the product's decomposition rules in the Decomposition workspace. The canvas also shows the complete hierarchy of the technical bundle structure when products decompose into technical product bundles. This enhanced visibility provides a more comprehensive view of the decomposition rules with increased clarity.

Prevent Callout Failures During External System Downtime

Configure callout fulfillment steps to stop execution automatically when the external system is under maintenance. This configurable offline support puts the steps on hold to prevent fatal failures. Callout steps on hold appear on the fulfillment plan for fulfillment operators and managers to track and act on.

Migrate Rules Between Salesforce Orgs

Speed up your deployment cycles and keep data consistent by easily moving decomposition rules and associated condition data between Salesforce orgs.

Orchestrate Industries Configure, Price, Quote (CPQ) Orders by Using Dynamic Revenue Orchestrator (DRO)

Use the advanced orchestration capabilities of DRO for Industries CPQ orders. As the platform is preintegrated with Industries CPQ, you can adopt DRO without migrating your commercial product data out of Enterprise Price Catalog (EPC). The preintegrated platform establishes accurate data exchange and a smooth transition.

Design and Visualize Decomposition Rules for Enterprise Price Catalog Products

Create and manage decomposition rules for Enterprise Price Catalog (EPC) products and product

classes by using the graphical interface in the Decomposition Workspace. View the complete hierarchy of the technical bundle structure and make the design process intuitive and user-friendly.

Orchestrate Move and Change of Plan Orders from Industries Configure, Price, Quote (CPQ)

Develop specialized fulfillment scenarios to manage asset transfers and plan changes in Industries CPQ. Manage asset movement between locations or accounts, and handle upgrades, downgrades, or plan switches after the initial purchase. With Dynamic Revenue Orchestrator, design precise fulfillment logic to manage services effectively, and establish proper execution and dependency management for all related tasks.

New Invocable Actions in Dynamic Revenue Orchestrator

Manage complex sales transactions more effectively by decomposing and orchestrating quotes or orders independently. Use the new invocable actions to improve the operational efficiency of a sales process.

Changed Metadata Type

The Flow metadata type has these new actionType values to manage complex sales transactions.

Changed Objects in Dynamic Revenue Orchestrator

Do more with these changed Dynamic Revenue Orchestrator objects.

Extend Orchestration to All Business Transaction Types

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Design and run orchestration for any business process with the usage type framework. Bring your own context definition and automate new business processes for non-sales transactions. For example, automate the Dunning process using the Collections Plan object. Dynamic Revenue Orchestrator (DRO) further automates generation of a generic, product-independent plans for orders.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced license.

How: To orchestrate a business process that's not based on a sales transaction, configure Orchestration Plan Config Mapping with the object and a custom context definition. DRO orchestrates the object based on the context definition and its custom object mapping.

Plug Custom Logic Between Decomposition and Plan Generation

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Insert custom logic to update the fulfillment order line item data between the order decomposition and plan generation processes. Make your purchase decisions only on the basis of generally available products and features.

Improve the efficiency of your usage model by streamlining product setup using validation tools and automating asset creation for complex usage products. Enhance pricing consistency and accuracy through rate capture, proactively monitor daily usage and overages to mitigate unexpected charges, and expand real-time visibility into customer wallet balances within Experience Cloud sites.

Expedite Product Setup by Using Usage Product Validator

Verify cross-object configurations when you set up Usage and Rating objects on your product record pages. Eliminate manual navigation across multiple related records by making sure that critical issues are flagged early during setup.

Save Quote and Order Rate Card Entries Automatically

Provide accurate and consistent usage pricing by generating rate card entries for quotes and orders whenever quotes are saved. The system captures catalog rates when the quote is saved, which prevents rate changes even if the catalog is updated later. This feature maintains stable pricing during quote reloads and also preserves backward compatibility.

Generate Assets for Usage Products with Order Item Action

Use the Create or Update Asset From Order Item Action API to create assets for usage-based products. Create assets directly from order products, including products with grant binding and rate selection. This method correctly assetizes usage products, preserves binding relationships, and automatically applies the appropriate rates during asset creation.

Avoid Unexpected Charges by Monitoring Daily Usage and Overages

View your current usage and updated overages on your summaries throughout the billing period. Help users make informed decisions about purchasing additional packs or commitments. Manage costs more efficiently by avoiding unexpected overage charges before invoice generation.

Provide Customers Visibility into Their Wallet Balances

Improves self-service adoption by giving your customers access to real-time wallet balances and existing consumption records. The Billing Self-Service Portal template now includes a wallet page where users can access wallet details without additional configuration.

New Connect REST APIs

Improve data integrity and compliance with enhanced validation for usage-based products. Access detailed consumption insights for accurate billing and reporting.

Expedite Product Setup by Using Usage Product Validator

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Verify cross-object configurations when you set up Usage and Rating objects on your product record pages. Eliminate manual navigation across multiple related records by making sure that critical issues are flagged early during setup.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced license.

Who: To use the Usage Product Validator, users need the Usage Management Design Time permission set.

How: Add the Usage Product Validator component to the Product page layout. Go to the individual product record page, and on the Usage Product Validator, click **Validate**.

Billing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Maintain accurate billing, reduce manual effort, and strengthen a reliable quote-to-cash process. Keep billing precise during complex updates and simplify customer inquiry with end-to-end dispute resolution process. Allocate shared charges across all parties and maintain consistent, audit-ready records. Streamline tax reporting with enhanced regional identifiers and product details. Manage payment adjustments easily and define custom rules to retry failed payments. Buyers can save their preferred payment methods for faster checkout.

Customer 360

Manage billing inquiries and disputes through a unified workflow and streamlined dispute resolution process. Give customers a comprehensive financial history to settle accounts.

Billing Foundation

Bill individual order items as they're delivered. Keep billing schedules consistent with the changes in billing frequency while also accounting for any partial periods.

Billing Amendments

Maintain accurate billing schedules during rollbacks, term or price changes, product swaps, and line-level date updates. Align billing schedules with changes to future-dated orders and quotes, and generate precise billing for multiple ramp deals.

Tax Management

Maintain financial accuracy by canceling and voiding credit memos and by supporting regional requirements with tax identifiers, tax codes, and header-level tax totals.

Invoice Management

Assign shared costs to the right billing account and split invoice charges accurately across multiple parties. Generate individual invoice documents with billing profile-specific templates.

Credit Memo Management

Apply unique sequential numbers to credit memos to keep records traceable, consistent, and audit-

ready.

Payments

Import pre-generated payment method tokens into your Salesforce org either individually or in bulk. Bring in your own payment methods generated by externally developed UI components. Retry failed payments, and set up rules to automatically apply credits and payments to the right invoices.

Accounting

View transaction amounts and summary records in functional currency, in addition to corporate currency.

New and Changed Objects for Billing

Store and access more data with these new Billing objects and changes to existing Billing objects.

New and Changed Connect REST APIs

Manage complex billing scenarios with new APIs for billing arrangement, payment and credit application based on predefined rules, and credit memo voidance. Generate on-demand invoices and comprehensive financial statements for transparent, complete financial reporting.

Changed Connect in Apex Class in Billing

Use the updated BillingAdvanced Apex class to void a credit memo, enabling the creation of a debit memo.

Changed Metadata Types in Billing

The updated BillingSettings metadata settings type enhances billing operations. It provides compliant sequential numbering for credit memos and automatic retry attempts for failed payments. You can track and resolve billing disputes, and settle invoices automatically by applying rule-based payments and credits.

New Invocable Actions in Billing

Improve financial accuracy and reduce manual effort by automating the credit and payment application and the credit memo voidance processes.

RulesAppln Namespace

The RulesAppln namespace contains output classes with details of a rule to apply payments and credits. The rules are applied by using the applyPaymentsAndCreditsByRules invocable action.

CommerceTax Namespace

The CommerceTax namespace has enhancements that eliminate rounding errors during the calculation of total tax for an invoice.

Customer 360

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage billing inquiries and disputes through a unified workflow and streamlined dispute resolution

process. Give customers a comprehensive financial history to settle accounts.

Resolve Billing Inquiries and Disputes Efficiently

Manage billing inquiries and disputes through a standardized, end-to-end dispute management process. Install pre-built service process templates easily from the Unified Catalog. Billing specialists or customer service representatives can initiate cases, and quickly capture, validate, and resolve common inquiries, all from a single catalog. Billing portal users can raise service requests through the self-service portal.

Summarize Billing Transactions with a Statement of Account

Use Generate Account Statement API to generate a single account statement that summarizes invoices, payments, credits, debits, and refunds of an account and its related accounts. Give customers a unified view of all billing activity in their account and its hierarchy. Automate the generation of these account statements by using the Generate Statement of Account invocable action in custom flows.

Resolve Billing Inquiries and Disputes Efficiently

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Bill individual order items as they're delivered. Keep billing schedules consistent with the changes in billing frequency while also accounting for any partial periods.

[Gain More Flexibility with Order Item Billing](#)

Improve billing accuracy and cash flow by billing order items and creating separate billing schedules

for each item. Generate invoices for delivered goods or services immediately, instead of waiting until the entire order is billed.

Offer Flexible Billing Frequencies for Quotes and Orders

Your sales representatives can now select a billing frequency on a transaction that differs from the product's pricing frequency. Convert shorter pricing terms, such as monthly or quarterly, into longer billing cycles such as semi-annual or annual. Get accurate billing for partial periods based on the actual number of days a product or subscription is used.

Gain More Flexibility with Order Item Billing

Billing Amendments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Maintain accurate billing schedules during rollbacks, term or price changes, product swaps, and line-level date updates. Align billing schedules with changes to future-dated orders and quotes, and generate precise billing for multiple ramp deals.

Align Billing Dates with Order Item Detail and Quote Line Detail Records

Get precise billing for orders and quotes that have multiple start and end periods. Billing prioritizes the start and end dates found on Quote Line Detail and Order Item Detail records. If no dates are specified on the detail records, then Billing uses the dates from the parent order or quote item.

Align Billing with Subscription Term Updates

Generate precise billing schedules automatically when your customer extends or shortens a subscription term during an amendment. Keep billing in sync with revised contractual terms by aligning billing schedules with the updated start and end dates on the order product.

Align Billing with Changes to Future-Dated Orders and Quotes

Support dynamic customer needs by processing billing for amendments and renewals that occur before a scheduled future-dated order or quote. Get accurate billing schedules for the amended or renewed assets under termed, evergreen, and one-time products. Ensure alignment with future billing periods and eliminate the need for manual reconciliation.

Capture Accurate Billable Amounts After Rollbacks

Update billing schedules automatically when customers roll back a future-dated amendment, renewal, or cancellation. The rollback adds adjusting billing schedules to negate the previous change, ensuring that the schedule shows the correct view of what to bill next. Maintain accurate billing and a clean, reliable schedule history without manual corrections.

Generate Precise Billing for Multiple Ramp Deals

Extend group ramps to support multiple billing schedules with accuracy and consistency. For each product ramp ID in a ramp deal, Billing creates a billing schedule group. For every segment in the

product ramp schedule, Billing creates a billing schedule in the billing schedule group to represent the group's ramping and timeline. Support accurate billing for independent ramp schedule groups across mixed asset types while keeping multi-asset amendments consistent.

Maintain Billing Accuracy During Price Changes

Automatically update billing amounts to reflect any changes in product pricing. Generate accurate billing schedules and invoices that capture any increase or decrease in the prices of termed, evergreen, or one-time product subscriptions.

Ensure Billing Accuracy During Product Swaps

Ensure billing accuracy when you swap one-time, evergreen, termed, and bundled products. Get auto-generated billing schedules for the products that are swapped out and swapped in.

Align Billing Dates with Order Item Detail and Quote Line Detail Records

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get precise billing for orders and quotes that have multiple start and end periods. Billing prioritizes the start and end dates found on Quote Line Detail and Order Item Detail records. Tax Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Maintain financial accuracy by canceling and voiding credit memos and by supporting regional requirements with tax identifiers, tax codes, and header-level tax totals.

[Maintain Tax Compliance with Credit Memo Voiding and Recovery](#)

Improve financial accuracy by recovering credit memos that are in error or pending states. You can also void posted credit memos and automatically create debit memos for them.

[Calculate Precise Tax for Products with Enhanced Tax Treatment Item Resolution](#)

Achieve greater flexibility when calculating taxes for different products across legal entities. Use tax treatment items within a tax treatment to assign specific tax codes to each product, supporting countries that require product-specific tax codes.

[Support Regional Tax Compliance by Capturing Header-Level Tax Totals](#)

Add efficiency to tax reporting by adding flexibility to your existing tax strategy. Prevent rounding discrepancies that can occur on transactions with thousands of tax lines. Capture overall tax totals in the transaction header while preserving detailed calculations at the line level.

[Calculate Taxes with the Standard Tax Engine](#)

Configure and apply taxes directly in the Billing app with the standard built-in tax engine for simple tax use cases. Capture multiple tax rates, set tax effective dates, and configure the priority of tax calculation.

[Meet Tax Compliance by Capturing Tax Identification Details](#)

Meet regional compliance regulations by using tax identifiers and other tax details on the billing account. Send this information automatically to tax engines when using our tax interface to support tax compliance.

Maintain Tax Compliance with Credit Memo Voiding and Recovery

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve financial accuracy by recovering credit memos that are in error or pending states. You can also void posted credit memos and automatically create debit memos for them.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Billing license.

Who: To recover and void credit memos, you need the Billing Admin, the Billing Operations User, or the Credit Memo Operations User permission set.

How: To recover credit memos, from the App Launcher, find and select **Credit Memos**. Open a credit memo in the pending or error state. Then click **Recover Credit Memo**. For credit memos with tax, the action creates a debit memo and voids the credit memo. For credit memos with no tax, the action simply cancels the credit memo.

To void a posted credit memo, open the credit memo record and click **Void Credit Memo**.

Calculate Precise Tax for Products with Enhanced Tax Treatment Item Resolution

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Achieve greater flexibility when calculating taxes for different products across legal entities. Use tax treatment items within a tax treatment to assign specific tax codes to each product, supporting countries that require product-specific tax codes.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue

Cloud Advanced or Revenue Cloud Billing license.

Who: To create and use tax treatment items, you need the Billing Admin or the Tax Admin permission set.

How: To calculate taxes based on tax codes assigned to products, from the App Launcher, find and select **Tax Treatments**. Configure a tax treatment, and select **Use Tax Treatment Items**. Define related tax treatment items to map products with their corresponding tax codes.

Support Regional Tax Compliance by Capturing Header-Level Tax Totals

Meet regional compliance regulations by using tax identifiers and other tax details on the billing account. Send this information automatically to tax engines when using our tax interface to support tax compliance.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced or Revenue Cloud Billing license.

Who: To configure tax identification details for your account, you need the Billing Admin or the Billing Operations User permission set.

How: Update the Billing Account fields such as tax identification number and tax exemption number. Define dynamic picklist values for tax exemption status and delivery terms to map them correctly to your external tax adapter. During tax calculation, Billing gets tax information from the billing account's default billing profile.

Invoice Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Assign shared costs to the right billing account and split invoice charges accurately across multiple parties. Generate individual invoice documents with billing profile-specific templates.

Allocate Invoice Charges Across Multiple Billing Accounts with Billing Arrangements

Support shared business models by separating the account that owns a service or asset from the account that's invoiced for it. Configure billing arrangements to allocate billing amounts to a specific billing account or distribute costs among several billing accounts, based on fixed percentages. Facilitate precise invoicing for complex business scenarios such as a parent account billed for subsidiary accounts, where the owning and billing accounts are different. Ensure that invoices are charged to the correct billing accounts for cross-departmental charge allocations, or when services or assets shared among multiple parties. Help organizations model complex financial relationships by automating allocation of invoice charges.

View Invoices in a Centralized List on Order Records

View all the invoices related to an order directly on the Order record page. The new All Invoices related list acts as a single source of truth, showing invoices generated by using invoice batch runs, Invoice Ingestion API, Invoice Creation API, and the Generate Invoice button. The list also includes invoices for the subsequent Amend, Renewal, or Cancellation orders.

Generate Personalized On-Demand Invoice Documents

Respond to customer needs faster by generating an individual invoice PDF with a single click. Generate urgent invoices without waiting for invoice batch runs. Meet business and compliance requirements by configuring customer-specific invoice templates in billing profiles, which override the Salesforce org default templates.

Allocate Invoice Charges Across Multiple Billing Accounts with Billing Arrangements

Generate Personalized On-Demand Invoice Documents

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Respond to customer needs faster by generating an individual invoice PDF with a single click. Generate urgent invoices without waiting for invoice batch runs. Meet business and compliance requirements by configuring customer-specific invoice templates in billing profiles, which override the Salesforce org default templates.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and

Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Billing license.

Who: To customize and manage invoice document templates, you need the DocGen Designer permission set. To generate on-demand invoice documents, you need the Billing Operations User or the Billing Customer Service User permission set, along with the Docgen User permission set.

How: To assign a preferred invoice document template for an account, from the App Launcher, find and select **Billing Accounts**. Configure the billing account to include an invoice document template. To generate an invoice document, from the App Launcher, find and select **Invoices**. Open a posted invoice record, and click **Generate Invoice Document**.

Credit Memo Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Apply unique sequential numbers to credit memos to keep records traceable, consistent, and audit-ready.

Organize Credit Memos by Using Sequential Numbering

Create traceable, consistent, and compliant credit memo records by assigning unique sequential numbers to posted credit memos. Manage bookkeeping and maintain legally compliant credit memo numbering.

Organize Credit Memos by Using Sequential Numbering

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create traceable, consistent, and compliant credit memo records by assigning unique sequential numbers to posted credit memos. Manage bookkeeping and maintain legally compliant credit memo numbering.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue

Cloud Billing license.

Who: To create sequence policies, you need the Billing Admin permission set.

How: In Setup, find and select **Billing Settings**.

- To assign sequential numbers to Credit Memo records, configure Gapless Sequential Numbering for Billing.
- To assign a credit memo number to each posted credit memo, turn on Mandate Sequence Policy for Posted Credit Memos.

To create sequence policies, from the App Launcher, find and select **Sequence Policies**. Then, define sequence patterns and filter criteria based on your needs.

Payments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Import pre-generated payment method tokens into your Salesforce org either individually or in bulk. Bring in your own payment methods generated by externally developed UI components. Retry failed payments, and set up rules to automatically apply credits and payments to the right invoices.

Add and Manage Saved Payment Methods by Using Pre-Tokenized Data

Bring your existing payment methods from native and third-party payment gateways into your Salesforce org by migrating the corresponding payment method tokens. You can import specific payment method tokens either individually or use a CSV file to upload multiple tokens into your Salesforce org. Map the tokens to specific payment types, including emerging options, such as digital wallets. Use the saved payment methods, without any further configuration, for both batch payment processing and in the Sale, Authorize, and Capture APIs. Integrate payment methods into your Salesforce org by bringing in external UI components from vendors of your choice.

Apply Credit Memos and Payments Automatically Based on Rules

Prevent revenue leakage, improve customer trust, and reduce the manual effort required for cash reconciliation with rule-based application of credit and payments. Prioritize applying either credits or payments to settle the invoices of customer accounts. Specify allocation rules in an order of your choice to settle the invoices of your account. Use the allocation rules to match invoices by the invoice ID or invoice balance, or prioritize oldest invoices or the ones with the highest balances.

Maximize Revenue Collection by Using Custom Payment Retries

Define rules to automatically retry payments that fail due to specific errors, such as an expired card or a temporary bank issue. Set up rules to reprocess failed payments based on the reason for the failure. Define the retry interval and the total number of attempts before a payment is finally considered as

failed. Capture more revenue and reduce manual collections work for your accounts receivables team.

[Accelerate Collections by Converting Debit Memos to Invoices](#)

Bring any outstanding amount into your accounts receivables workflow by generating invoices from debit memos. Convert standalone debit memos to invoices by using Invoice Ingestion API. This feature helps to simplify and accelerate payment collections.

Add and Manage Saved Payment Methods by Using Pre-Tokenized Data

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. New and Changed Objects for Billing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Store and access more data with these new Billing objects and changes to existing Billing objects.

New Objects

Get details about how a transaction's billing amount is allocated to one or more accounts

Use the new `BillingArrangement` object.

Get details about the billing account, billing profile, and the percentage of the billing amount assigned to that account

Use the new `BillingArrangementLine` object.

Get tax information associated with a debit memo line

Use the new `DebitMemoLineTax` object.

Get information about an expression set

Use the new `ExpressionSet` object.

Get information about the payment retry rule applied when a payment schedule item fails

Use the new `PaymentRetryRule` object.

Get information about the payment retry policy that defines how failed payments are retried based on error codes across different retry categories

Use the new `PaymentRetryRuleSet` object.

Get information about the tax rate applied to a transaction, determined by the applicable tax code and country

Use the new `TaxRate` object.

Get tax code information used by a specific tax engine to calculate tax for a product

Use the new `TaxTreatmentItem` object.

Changed Objects

Specify additional tax identification details

Use the new `AdditionalTaxIdentificationDetails` field on the existing `BillingAccount` object.

Specify the standard code in internal trades that's used to define shipping responsibilities

Use the new `DeliveryTerms` field on the existing `BillingAccount` object.

Specify the document template that's used to generate the invoice PDF documents

Use the new `InvoiceDocumentTemplate` field on the existing `BillingAccount` object.

Specify the date until which the tax exemption is valid

Use the new `TaxExemptionExpirationDate` field on the existing `BillingAccount` object.

Specify the identifier that's used to indicate that a transaction is tax exempt

Use the new **TaxExemptionNumber** field on the existing BillingAccount object.

Specify the status of the tax exemption

Use the new **TaxExemptionStatus** field on the existing BillingAccount object.

Stores the tax identification number

Use the new **TaxIdentificationNumber** field on the existing BillingAccount object.

Stores the unit of time for which the pricing of the product applies

Use the new **PricingTermUnit** field on the existing BillingSchedule object.

Stores the ID of the billing arrangement record that's related to the billing schedule group

Use the new **BillingArrangement** field on the existing BillingScheduleGroup object.

Stores the usage type of the billing schedule group

Use the new **UsageType** field on the existing BillingScheduleGroup object.

Specify whether the billing frequency can be changed for the billing treatment

Use the new **CanChangeBillingFrequency** field on the existing BillingTreatment object.

Configure the credit memo's source action based on resolving incorrect invoice charges

Use the new supported value **DisputeManagement** in the existing **Category** field on the CreditMemo object.

Stores a credit memo's sum of the total amount with tax in functional currency

Use the new **FuncCrcyCnvTotAmtWithTax** field on the existing CreditMemo object.

Stores the date on which a credit memo's total amount with tax is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing CreditMemo object.

Specify the exchange rate that's used to convert a credit memo's total amount with tax into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing CreditMemo object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing CreditMemo object.

Specify whether the credit memo is currently in a void in progress state

Use the new supported value **VoidInProgress** in the existing **Status** field on the CreditMemo object.

Stores the total tax amount for the credit memo, calculated at the header level by the tax engine

Use the new **TotalTaxesCapturedAtHeader** field on the existing CreditMemo object.

Stores a credit memo line's charge amount in functional currency

Use the new **FuncCurrencyCnvChargeAmt** field on the existing CreditMemoLine object.

Stores a credit memo line's total tax amount in functional currency

Use the new **FuncCrcyCnvTotalTaxAmount** field on the existing CreditMemoLine object.

Stores the date on which a credit memo line's amounts are converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing CreditMemoLine object.

Specify the exchange rate that's used to convert a credit memo line's amounts into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing CreditMemoLine object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing CreditMemoLine object.

Stores a credit memo line tax's tax amount in functional currency

Use the new **FuncCrcyConvertedTaxAmount** field on the existing CreditMemoLineTax object.

Stores the date on which a credit memo line tax's tax amount is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing CreditMemoLineTax object.

Specify the exchange rate that's used to convert credit memo line tax's tax amount into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing CreditMemoLineTax object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing CreditMemoLineTax object.

Stores a debit memo's sum of the total charge amount in functional currency

Use the new **FuncCrcyCnvTotalChargeAmt** field on the existing DebitMemo object.

Stores the date on which a debit memo's total charge amount is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing DebitMemo object.

Specify the exchange rate that's used to convert a debit memo's total charge amount into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing DebitMemo object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing DebitMemo object.

Specify whether invoice generation isn't applicable to the debit memo

Use the new supported value **NotApplicable** in the existing **InvoiceGenerationStatus** field on the DebitMemo object.

Stores the credit memo record ID associated with the debit memo record

Use the new **ReferenceRecord** field on the existing DebitMemo object.

Specify whether the debit memo is currently in a void in progress state

Use the new supported value **VoidInProgress** in the existing **Status** field on the DebitMemo object.

Stores the sum of the debit memo's total line amount and total adjustment amount

Use the new **TotalAmount** field on the existing DebitMemo object.

Stores the sum of the total amount values for the debit memo's tax lines

Use the new **TotalTaxAmount** field on the existing DebitMemo object.

Stores the sum of the total amount with the tax on the debit memo line in corporate currency

Use the new **CorpCurrCnvTotTaxAmt** field on the existing DebitMemoLine object.

Stores a debit memo line's charge amount in functional currency

Use the new **FuncCrcyCnvChargeAmount** field on the existing DebitMemoLine object.

Stores the date on which a debit memo line's amounts are converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing DebitMemoLine object.

Specify the exchange rate that's used to convert a debit memo line's amounts into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing DebitMemoLine object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing DebitMemoLine object.

Stores total tax amount value in functional currency

Use the new **FuncCrcyCnvTotalTaxAmt** field on the existing DebitMemoLine object.

Stores the amount of the debit memo line

Use the new **LineAmount** field on the existing DebitMemoLine object.

Stores the credit memo line record ID associated with the debit memo line record

Use the new supported value `CreditMemoLine` in the existing `ReferenceRecord` field on the `DebitMemoLine` object.

Stores the ship from address specified in the parent debit line

Use the new `ShipFromAddress` field on the existing `DebitMemoLine` object.

Stores the tax amount of the debit memo line

Use the new `TaxAmount` field on the existing `DebitMemoLine` object.

Specify the status of the tax calculation

Use the new `TaxCalculationStatus` field on the existing `DebitMemoLine` object.

Stores the document number of the latest record in the external tax engine where the parent debit line is included

Use the new `TaxDocumentNumber` field on the existing `DebitMemoLine` object.

Specify the date that's used to calculate the tax amount

Use the new `TaxEffectiveDate` field on the existing `DebitMemoLine` object.

Stores a debit memo line tax's charge amount in functional currency

Use the new `FuncCrcyCnvChargeAmount` field on the existing `DebitMemoLineTax` object.

Stores the date on which a debit memo line's amounts are converted into functional currency

Use the new `FunctionalCurrencyCvsnDate` field on the existing `DebitMemoLineTax` object.

Specify the exchange rate that's used to convert a debit memo line's amounts into functional currency

Use the new `FunctionalCurrencyCvsnRate` field on the existing `DebitMemoLineTax` object.

Stores the currency ISO code of the functional currency

Use the new `FunctionalCurrencyIsoCode` field on the existing `DebitMemoLineTax` object.

Stores the ID of the billing arrangement record that's related to the invoice

Use the new `BillingArrangement` field on the existing `Invoice` object.

Stores the version number of the billing arrangement record that's used to generate the invoice

Use the new `BillingArrangementVerNumber` field on the existing `Invoice` object.

Stores the identifier that's used to associate and track invoices that are generated based on the same billing arrangement

Use the new `CorrelationIdentifier` field on the existing `Invoice` object.

Stores the date on which an invoice's total amount with tax is converted into functional currency

Use the new **FuncCrcyCnvTotAmtWithTax** field on the existing Invoice object.

Stores the date on which an invoice's total amount with tax is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing Invoice object.

Specify the exchange rate that's used to convert an invoice's total amount with tax into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing Invoice object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing Invoice object.

Stores the total tax amount for the invoice, calculated at the header level by the tax engine

Use the new **TotalTaxesCapturedAtHeader** field on the existing Invoice object.

Stores an invoice line's charge amount in functional currency

Use the new **FuncCurrencyCnvChargeAmt** field on the existing InvoiceLine object.

Stores an invoice line's total tax amount in functional currency

Use the new **FuncCrcyCnvTotalTaxAmt** field on the existing InvoiceLine object.

Stores the date on which an invoice line's amounts are converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing InvoiceLine object.

Specify the exchange rate that's used to convert an invoice line's amounts into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing InvoiceLine object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing InvoiceLine object.

Stores the tax amount of an invoice line tax in functional currency

Use the new **FuncCrcyCnvTaxAmount** field on the existing InvoiceLineTax object.

Stores the date on which an invoice line tax's tax amount is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the existing InvoiceLineTax object.

Specify the exchange rate that's used to convert an invoice line tax's tax amount into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the existing InvoiceLineTax object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the existing InvoiceLineTax object.

Stores a payment's amount in functional currency

Use the new **FunctionalCurrencyCnvAmount** field on the Payment object.

Stores the date on which a payment's amount is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the Payment object.

Specify the exchange rate that's used to convert a payment's amount into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the Payment object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the Payment object.

Specify whether the payment batch run is used for retrying a failed payment

Use the new **IsPaymentRetry** field on the PaymentBatchRun object.

Specify the slated time of the next payment retry for the payment schedule item

Use the new **NextPaymentRetryTime** field on the existing PaymentScheduleItem object.

Stores the category of payment gateway errors for the payment schedule item

Use the new **PaymentGatewayErrorCategory** field on the existing PaymentScheduleItem object.

Stores the raw error code from the payment gateway for the payment schedule item

Use the new **PaymentGatewayErrorCode** field on the existing PaymentScheduleItem object.

Stores the number of payment retries that were attempted on the payment schedule item

Use the new **PaymentRetryCount** field on the existing PaymentScheduleItem object.

Stores a refund's amount in functional currency

Use the new **FunctionalCurrencyCnvAmount** field on the Refund object.

Stores the date on which a refund's amount is converted into functional currency

Use the new **FunctionalCurrencyCvsnDate** field on the Refund object.

Specify the exchange rate that's used to convert a refund's amount into functional currency

Use the new **FunctionalCurrencyCvsnRate** field on the Refund object.

Stores the currency ISO code of the functional currency

Use the new **FunctionalCurrencyIsoCode** field on the Refund object.

Specify whether an error occurred while processing a void credit memo or an invoice batch run rule-based credit and payment application request

Use the new supported values **VoidCreditMemo** and **InvoiceBatchRunRuleBasedCreditandPaymentApplication** in the existing **Category** field on the RevenueTransactionErrorLog object.

Specify whether the sequence policy is applied to a credit memo record

Use the new supported value **CreditMemo** in the existing **TargetObject** field on the SequencePolicy object.

Specify whether taxes are captured at the header level

Use the new **ShouldCaptureTaxesAtHeader** field on the existing TaxEngine object.

Specify whether Revenue Standard Tax Engine is used to calculate tax

Use the new supported value **RevenueStandardTaxEngine** in the existing **Type** field on the TaxEngine object.

Specify whether the tax codes and product codes of the related tax treatment items must be used when requesting tax calculations

Use the new **ShouldUseTaxTreatmentItems** field on the existing TaxTreatment object.

REMOVED: The TaxCode field on the DebitMemoLineTax object is removed

The TaxCode field on the DebitMemoLineTax object is removed from API version 66.0 and later. Instead, use the **JurisdictionTaxCode** field on the existing DebitMemoLineTax object.

New and Changed Connect REST APIs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage complex billing scenarios with new APIs for billing arrangement, payment and credit application based on predefined rules, and credit memo voidance. Generate on-demand invoices and

comprehensive financial statements for transparent, complete financial reporting.

Get a specified billing arrangement and the associated billing arrangement lines

Make a GET request to the `/revenue/billing/billing-arrangement/billingArrangementId` resource.

New response body: Billing Arrangement

Apply payments and credits to an account's invoices based on specified rules based on Billing Settings

Make a POST request to the `/revenue/billing/transactions/actions/apply` resource.

New request body: Rules Application Input

New response body: Rules Application

Void a credit memo in posted state

Make a POST request to the `/commerce/billing/credit-memos/creditMemoId/actions/void` resource.

New request body: Void Posted Credit Memo Input

New response body: Void Posted Credit Memo

Generate an invoice document for a record, and update any junction object record

Make a POST request to the `/revenue/billing/document/actions/generate` resource.

New request body: On Demand Document Generation Input

New response body: On Demand Document Generation

Generate comprehensive financial statements with transaction history and balance information

Make a POST request to the `/revenue/billing/accounts/accountId/statement` resource.

New request body: Statement Of Account Input

New response body: Statement Of Account

Changed Connect REST API Request Bodies

Convert debit memos to invoices for consistent and gapless numbering for credit memo records through these API enhancements.

Invoice Ingestion Input

This request body has an update.

`referenceEntityId` –Specify the debit memo ID to convert debit memos to invoices.

Sequence Policy Input

This request body has an update.

`targetObject` –Use the new `CreditMemo` enum value to create a sequence policy for a credit memo.

Sequence Gap Reconciliation Input

This request body has an update.

`targetObjects` –Use the new `CreditMemo` enum value to identify gaps in gapless-enabled sequences for a credit memo.

Changed Connect in Apex Class in Billing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the updated `BillingAdvanced` Apex class to void a credit memo, enabling the creation of a debit memo.

This new method is available in the `ConnectApi.BillingAdvanced` class.

Void a credit memo in posted state

`voidPostedCreditMemo (voidPostedCreditMemoInputRepresentation)`

New input class: `ConnectApi.VoidPostedCreditMemoInputRepresentation`

New output class: `ConnectApi.VoidPostedCreditMemoOutputRepresentation`

Changed Metadata Types in Billing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The updated `BillingSettings` metadata settings type enhances billing operations. It provides compliant sequential numbering for credit memos and automatic retry attempts for failed payments. You can track and resolve billing disputes, and settle invoices automatically by applying rule-based payments and credits.

Metadata Types

Apply unique sequence numbers to credit memo records

Use the new `enableCreditMemoSequenceService` field on the existing `BillingSettings` metadata type.

Retry payments that failed due to errors

Use the new `enableFailedPaymentsRetry` field on the existing `BillingSettings` metadata type.

Track and resolve billing inquiries, service requests, and invoice-related disputes

Use the new `enableBillingDisputeManagement` field on the existing `BillingSettings` metadata type.

Settle posted invoices automatically by applying rule-based payments and credits

Use the new `ruleBasedCrAndPymtAppIn` field on the existing `BillingSettings` metadata type.

New Invocable Actions in Billing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve financial accuracy and reduce manual effort by automating the credit and payment application and the credit memo voidance processes.

Apply payments and credits to posted invoices by adhering to specified rules

Use the new `applyPaymentsAndCreditsByRules` action.

Void a posted credit memo to a credit memo

Use the new `voidPostedCreditMemo` action.

RulesAppln Namespace

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The `RulesAppln` namespace contains output classes with details of a rule to apply payments and credits. The rules are applied by using the `applyPaymentsAndCreditsByRules` invocable action.

New Classes

Get details of the rule application

Use the new `RulesAppln.RulesApplicationResponse` class.

Get output of the `applyPaymentsAndCreditsByRules` invocable action

Use the new `RulesAppln.RulesApplicationSummaryResponse` class.

Get error code and error message details

Use the new `RulesAppln.RulesApplicationErrorResponse` class.

Salesforce Contracts

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Contract authors and template designers have greater control over how they structure, style, and review contract content. Improvements to section behavior, clause formatting, and profile-based access help maintain consistent layouts, protect sensitive content, and make sure that the intended users participate in internal reviews. Expanded reconciliation and token capabilities keep data accurate across contracts, line items, and related records. Large and complex documents are more responsive during editing, comparison, and check-in. Document Template migration improvements further preserve document structure and clause relationships as they move between Salesforce orgs.

Control Section Name Visibility When Inserting Content

Template designers and contract authors can choose whether a section name appears in the generated document. Previously, section name always appeared. They can now delete section names in the Microsoft 365 editor when they don't want it to appear in the generated document. The section name remains visible under the Section tab in the Microsoft 365 add-in panel to manage section content.

Preserve Formatting When Inserting Clauses

Clauses now retain their defined indentation, line spacing, lists, fonts, and other rich text formatting

defined in the clause library when inserted into a document. Previously, inserting clauses into a Microsoft 365 template and contract document caused the document styles to override the clause's original formatting.

Assign Profile-Based Access for Sections

Control who can update sensitive content, including token values, by limiting section-level access to specific profiles. During template creation, the designer can select which profiles can edit a section for contract authoring and internal review.

Control Internal Reviewers Based on Users or Profiles

Contract authors can choose between a user-based or profile-based mode when initiating internal reviews. Prevent unintended edits and keep review activities focused on the appropriate participants.

Reconcile More Data with Expanded Data True-Up Capacity

The Microsoft 365 Word Data True-Up feature now handles more than 200 field tokens and includes support for line item tokens, improving reconciliation across contract fields and detailed line item values. Data True-Up also supports reconciling data sourced from related records, such as quotes and opportunities.

Review Redline Differences in a Comparison Document

Get full visibility of changes when reviewing contract versions. You can generate a comparison document that highlights added, edited, and deleted content relative to the base version. This enhancement makes it easier to understand changes introduced during redlining across contract document versions.

Improve Document Accuracy with Advanced Data True-Up Enhancements

Data True-Up token processing now supports nested object structures and reference fields up to one level, including related objects, such as opportunities and quotes. You can pull token values from related records rather than only from contracts, improving reconciliation accuracy for complex data. Support for reference fields on custom objects also helps keep contract data aligned with information stored across your data model.

Migrate Templates Across Salesforce Environments

Move Microsoft 365 document templates between Salesforce orgs while preserving clause references and section-level access controls. For example, move templates from a sandbox to a production org. This process helps maintain template integrity across orgs and environments. Before migrating templates, use a data migration tool to transfer the clause records, clause versions, and profile data to the target org. After you migrate the template, the built-in key mapping aligns the clause and profile references with the corresponding clause records in the target org.

Manage Document Check-In Behavior with Configurable Async Processing

Reduce latency and timeouts when checking in large documents with asynchronous processing. Check-in occurs asynchronously when a document contains more than 200 doc elements, such as sections, clauses, and tokens in the Microsoft 365 document. Async check-in is enabled by default, but you can disable it to make all check-ins run synchronously.

Find Content in Sections and Clauses Faster

Contract authors can navigate large documents more easily with the new search field on the Sections and Standalone Clauses tabs of the Microsoft 365 add-in. The search results update with each keystroke and show only matching items in the panel, helping you locate the right content quickly without manual scrolling. Search also expands collapsed sections when it finds relevant results.

Changed Connect REST API Request Bodies in Salesforce Contracts

The Content Link Load and Data Sync APIs include enhancements to reduce multiple per-field queries into a single grouped fetch request for improved performance.

Control Section Name Visibility When Inserting Content

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Template designers and contract authors can choose whether a section name appears in the generated document. Previously, section name always appeared. They can now delete section names in the Microsoft 365 editor when they don't want it to appear in the generated document. The section name remains visible under the Section tab in the Microsoft 365 add-in panel to manage section content.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced license, or with the Salesforce Contracts license.

Who: To edit section properties within a document template, you need the Microsoft 365 Word Designer permission set.

Preserve Formatting When Inserting Clauses

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Clauses now retain their defined indentation, line spacing, lists, fonts, and other rich text formatting defined in the clause library when inserted into a document. Previously, inserting clauses into a Microsoft 365 template and contract document caused the document styles to override the clause's original formatting.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced license, or with the Salesforce Contracts license.

Why: Earlier template designers and contract authors had to fix alignment and formatting manually

during template designing and contract editing, leading to inconsistent clause presentation. This enhancement preserves clause formatting unless authors or designers intentionally change it, reducing rework and keeping clause content consistent across templates and documents.

Assign Profile-Based Access for Sections

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Control who can update sensitive content, including token values, by limiting section-level access to specific profiles. During template creation, the designer can select which profiles can edit a section for contract authoring and internal review.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced license, or with the Salesforce Contracts license.

Why: Section-level edit access provides stronger control over critical content and prevents unintended edits by users without the appropriate profile permissions.

Salesforce Document Generation

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Generate clearer documents with precise data by applying data filters, transformation logic, and richer token coverage. These updates help make sure that structured content, nested values, and line item details are present accurately. Generate large documents more efficiently, even when they include substantial content or complex formatting. Achieve consistent in-browser previews by using the hybrid file handling setting. Remove interim previews in Omniscripts to keep only the final version and reduce storage use.

Filter Context Data for Document Generation

Apply a context filter in the template designer so that generated documents include only the data that meets your criteria. Select from predefined filters that support up to 5 conditions to fetch precise and relevant data from your context definitions. Adding a filter at design time avoids extra inputs, reduces errors, and delivers consistent and high-quality document output. For example, filter order items to include only products priced above a certain threshold, and sort them by quantity so that the generated document highlights the most relevant items. Document Generation in the Omnistudio managed package doesn't support Context Service.

Transform Context Data Before Generating Documents

Generate documents with clean, standardized, and business-ready data content by transforming the context data using the sample Apex plug-in. Run the Apex plug-in after context hydration to adjust formatting, grouping, string manipulation, token value changes, and other lightweight changes to meet business needs. This capability enables advanced transformation logic for scenarios that filtering alone can't address. For example, transform flat line items into a bundle with child products so that the document shows each bundle with its related components. You can also group line items by category or region so that the document presents organized sections with related items together. Document Generation in the Omnistudio managed package doesn't support this Apex plug-in.

Generate Larger Documents with Expanded File Size Support

Scale document generation to support larger outputs, generating single PDF, DOCX, or PPTX files up to 200 MB. This enhancement enables high-volume, media-rich, and evidence-heavy use cases and helps you generate complete documents in one pass without splitting content or assembling files outside Salesforce.

Preview Documents by Using Hybrid Setting Across Contracts and Omniscrypts

The PDF document previewer provides secure in-browser previewing when you configure Salesforce file upload and download security settings. The PDF previewer now works with the hybrid file handling setting instead of relying only on the execute-in-browser option. The hybrid file handling setting improves preview consistency across browsers and Experience Cloud sites.

Manage Preview Document Storage in Omniscrypts

Document reviews often involve regenerating the preview several times, resulting in multiple stored files and increased storage consumption. You can now easily discard intermediate previews by clicking the delete icon in Omniscrypts to keep only the final version, reducing costs and achieving storage organization.

Filter Context Data for Document Generation

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Agentforce for Revenue Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Support partner quoting with rule-based product recommendations and expand billing data access for internal teams. Improve invoice charge explanations for community users. Identify token over-consumption with automated generation of targeted token pack quotes.

Get Product Recommendations While Adding Products

Help sales reps discover and add relevant or complementary products more efficiently when building a quote. Use predefined configuration rules to guide them with recommendations that lead to more complete and accurate quotes.

Explain Invoice Charges Faster with Conversational AI

Clarify invoice charges and answer basic questions related to billing through the Billing Service Assistant. Help your customers receive detailed charge breakdowns for ambiguous invoice line items, without needing to contact support.

Resolve Common Billing Inquiries Quickly with Billing Employee Assistant

Access critical billing information through conversational AI. Help billing teams retrieve payment plan details, latest bill details, account summaries and outstanding balances quickly. Billing teams can identify upcoming payment due dates and amounts within the assistant, without checking individual Billing records. Make it easier to respond to billing queries that require reviewing multiple invoice and payment records. Accelerate response time and reduce manual navigation across billing records.

View Your Consumption Overages in Tokens

Eliminate the manual effort involved in identifying token overages. Agentforce identifies token overage at the account level and help in creating quotes with appropriate token packs, which enables sales teams to upsell token packs easily.

Streamline Quoting for Partners by Using Agentforce

Help your partner users accelerate their sales cycle with the Revenue Quote Management agent template. By connecting the Agentforce Employee agent to their site by using Embedded Messaging, partners gain access to powerful, advanced quoting agent actions.

Get Product Recommendations While Adding Products

Clarify invoice charges and answer basic questions related to billing through the Billing Service Assistant. Help your customers receive detailed charge breakdowns for ambiguous invoice line items, without needing to contact support.

Where: This change applies to Lightning Experience and Experience Cloud in Enterprise, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud. It requires the Revenue Cloud Billing license, Einstein GPT, the Agentforce Service Agent add-on, the Flex Credits Metering add-on, and the Usage Management add-on.

Who: This feature is available to community users with access to the Billing Service Assistant template and these permission sets:

- Access Agentforce Default Agent
- Billing Experience Cloud User
- Billing Einstein Experience Cloud User
- Prompt Template User

How: From Setup, turn on Einstein and Agentforce. Create an agent by using the Billing Service Assistant template and activate it. Configure the assistant for your Experience Cloud site and expose it through Embedded Messaging. Assign the required permission sets to community users. Users can then interact with the assistant to request explanations of invoice charges directly from the chat interface.

Resolve Common Billing Inquiries Quickly with Billing Employee Assistant

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Access critical billing information through conversational AI. Help billing teams retrieve payment plan details, latest bill details, account summaries and outstanding balances quickly. Billing teams can identify upcoming payment due dates and amounts within the assistant, without checking individual Billing records. Make it easier to respond to billing queries that require reviewing multiple invoice and payment records. Accelerate response time and reduce manual navigation across billing records.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud. It requires the Revenue Cloud Billing license, Flex Credits Metering add-on, and the Agentforce Employee Rep add-on.

Who: This feature is available to billing admins and billing operations users who have access to the Billing Employee Assistant template and the Agentforce and Billing permission sets.

How: From Setup, turn on Einstein and Agentforce. Create an agent by using the Billing Employee Assistant template and activate it.

View Your Consumption Overages in Tokens

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Eliminate the manual effort involved in identifying token overages. Agentforce identifies token overage at the account level and help in creating quotes with appropriate token packs, which enables sales teams to upsell token packs easily.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Revenue Cloud Advanced license, the Revenue Cloud Billing license, and the Agentforce Employee Agent add-on license.

How: From Setup, turn on Einstein generative AI and then turn on Agentforce.

To enable this feature, add the Consumption Management topic to your agent, and then turn on Rate Management and Usage Management.

To retrieve consumption details for a token resource, go to Agentforce Revenue Management and open an account. Click the Agentforce icon and enter your request in the chat. If needed, Agentforce asks for clarification and then provides token details. You can then use the consumption details to generate a quote for review and revision.

Streamline Quoting for Partners by Using Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help your partner users accelerate their sales cycle with the Revenue Quote Management agent template. By connecting the Agentforce Employee agent to their site by using Embedded Messaging, partners gain access to powerful, advanced quoting agent actions.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions of Agentforce Revenue Management, formerly Revenue Cloud, with the Agentforce Employee Agent and the Partner Community add-on licenses.

How: Set up Embedded Messaging in your Experience Cloud partner site. Route chats to the Revenue Quote Management agent by using an Omni-Channel flow, and add the embedded messaging component to the partner site so that partners can chat with the agent directly from the portal.

Sales

Learn about the latest features and updates to grow your pipeline and increase the efficiency of your sales teams. Sales Cloud is now Agentforce Sales. You may see references to Sales Cloud in our application and documentation.

[AI Agents for Sales](#)

Scale your sales team by using sales agents.

[Sales Fundamentals](#)

Simplify the setup of basic features and AI-agents for your sales teams with just a few clicks.

[Einstein Conversation Insights](#)

Get your generative AI features bundled together with Generative ECI, which combines the call summary and generative conversation insight capabilities under a single feature. We're also making speedy call processing more widely available with Vendor Transcript Processing. If you have Salesforce

1 Sales Edition, access deal closing recaps. More ECI data is available on the Salesforce Platform. Your sales teams can use call transcripts from Gong with ECI. And we've improved participant matching for Microsoft Teams video calls.

Sales Programs and Partner Tracks with Enablement

Drive revenue growth for sales territories, and manage users for your Enablement programs efficiently.

Sales Performance Management

Refine territory design in complex markets by assigning shared boundaries to multiple sales areas. Distribute financial targets directly to accounts while accounting for existing bottom-up goals. Plus, streamline the sales planning process by generating quota plans based on territory alignments to keep data synchronized.

Email, Calendar, and Integrations

Adopt authorized email domains. Accurately monitor event and email syncing with detailed insights and reports. Capture and report on email as an activity with the Sync Email as Salesforce Activity feature. Prepare for the retirement of Exchange Web Services and its impact on email-related features and products. Salesforce for Outlook retires in December 2027.

Other Changes in Sales

Review and anticipate other changes that can impact your sales team.

AI Agents for Sales

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Scale your sales team by using sales agents.

Agentforce Inbound Lead Generation

Create and deploy an agent to automate your lead generation process.

Agentforce Qualification

Qualify the ideal prospects for your business within the guided setup of both Agentforce Inbound Lead Generation and Agentforce Lead Nurturing.

Agentforce Lead Nurturing

Set up and test Agentforce Lead Nurturing all in one place with fewer clicks. See agent performance with the SDR Agent Analytics Dashboard and assign more prospects to an agent at once.

Agentforce Sales Management

Create and deploy agents to help your reps throughout the sales process. Now, Agentforce helps you with account research, meeting prep, and account briefs. And, streamline follow-up tasks with post-meeting suggestions. Save time and effort on configuration with Pipeline Management setup in Salesforce Go. Use Agentforce in Slack to manage both deals and accounts from the familiar Slack interface.

Agentforce Sales App in ChatGPT (Beta)

Give your sales team a single view to strategize and manage deals with the Agentforce Sales App in ChatGPT.

Agentforce Inbound Lead Generation

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create and deploy an agent to automate your lead generation process.

Capture Leads and Schedule Meetings Autonomously

Effortlessly capture inbound web and messaging leads, answer inquiries, and schedule meetings with your prospects by setting up Inbound Lead Generation.

Continue Lead Engagement with Agent Handoff

Guarantee continued engagement with prospects by automating lead handoffs between the Inbound Lead Generation and Lead Nurturing sales agents. Prospects created by the Inbound Lead Generation agent who don't schedule a meeting can automatically get assigned to the Lead Nurturing agent for a faster follow-up and to maximize conversion rates.

Capture Leads and Schedule Meetings Autonomously

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Effortlessly capture inbound web and messaging leads, answer inquiries, and schedule meetings with your prospects by setting up Inbound Lead Generation.

Where: This feature is available in Lightning Experience in Enterprise, Performance, and Unlimited editions with the Agentforce for Sales add-on. Setup for agents is available on the desktop site.

When: Inbound Lead Generation became available in early October 2025.

Why: To enhance sales efficiency by streamlining your customer intake process, reduce data entry, engage with customers, and drive more closed deals.

How: From Salesforce Go, navigate to the Agentforce for Sales setup page and select **Inbound Lead Generation**. Follow the guided setup to enable the required features, assign permissions, and get your agent generating leads.

Continue Lead Engagement with Agent Handoff

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Guarantee continued engagement with prospects by automating lead handoffs between the Inbound Lead Generation and Lead Nurturing sales agents. Prospects created by the Inbound Lead Generation agent who don't schedule a meeting can automatically get assigned to the Lead Nurturing agent for a faster follow-up and to maximize conversion rates.

Where: This feature is available in Lightning Experience in Enterprise, Performance, and Unlimited editions.

When: This feature is available starting mid December.

How: From Salesforce Go, go to the agent configuration for Inbound Lead Generation. In the Capture Prospect Info step, turn on Handoff to Lead Generation Agent. Select the Lead Nurture agent to handoff to and the amount of time to wait before handing off.

Agentforce Qualification

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Qualify the ideal prospects for your business within the guided setup of both Agentforce Inbound Lead Generation and Agentforce Lead Nurturing.

[Automate Qualification with Agentforce](#)

Seamlessly qualify leads and build a stronger pipeline with Agentforce for Sales. This enhancement

allows your Agent to determine how strong of a fit a prospect is based on their conversation and how well they meet your Ideal Customer Profile (ICP). Qualification helps sales reps focus on high-potential deals, improving overall efficiency and conversion rates.

Automate Qualification with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Seamlessly qualify leads and build a stronger pipeline with Agentforce for Sales. This enhancement allows your Agent to determine how strong of a fit a prospect is based on their conversation and how well they meet your Ideal Customer Profile (ICP). Qualification helps sales reps focus on high-potential deals, improving overall efficiency and conversion rates.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with the Sales Cloud and Einstein for Sales. Setup for agents is available on the desktop site.

When: This functionality is available on a rolling basis starting on January 6, 2025.

Why: Sellers currently spend most of their time on prospecting activities like lead qualification, which can consume 6–8 hours each week. This agentic qualification frees up time for your sales team to focus on direct selling activities.

How: From your Lead Gen or Lead Nurture agent's guided config, turn on Qualification. Review the default configuration, provide your company's Ideal Customer Profile, and start your qualifying journey

Following a web or email conversation, the Qualification Agent automatically generates and updates a Lead record with a rating. If the Lead is considered Hot, the record owner will be assigned a Task to review the qualification summary and take an action.

Agentforce Lead Nurturing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Set up and test Agentforce Lead Nurturing all in one place with fewer clicks. See agent performance with the SDR Agent Analytics Dashboard and assign more prospects to an agent at once.

Set Up Agentforce Lead Nurturing Faster with Guided Configuration

When you're ready to create a Lead Nurturing agent, the new guided setup experience in Salesforce Go saves you time and simplifies the process by automating several steps.

Scale Up Lead Nurturing Activity with Automatic Limit Management

Agentforce now manages the Lead Nurturing prospect outreach queue automatically so that agents can nurture large numbers of prospects simultaneously while respecting email send and LLM request limits.

Build Pipeline Faster by Assigning Prospects to Agentforce Lead Nurturing in Bulk

Users can now assign up to 200 prospects at once to a Lead Nurturing agent from list views. Agentforce adds assignments that exceed email send or LLM limits to a managed queue that's visible in the Agent Command Center. Previously, you could only assign records one at a time or by using assignment rules in the agent configuration. Adding more than 30 prospects at a time sometimes caused an error. The managed queue eliminates these errors.

Control and Customize Agent Behavior Faster with Modular Topics and Actions

You can now directly view and modify each step of the Lead Nurturing agent workflow, eliminating the need for complex prompt engineering. In Agentforce Builder, the agent's logic appears as discrete, configurable topics and actions that are easy to navigate and edit.

Set Up Agentforce Lead Nurturing Faster with Guided Configuration

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

When you're ready to create a Lead Nurturing agent, the new guided setup experience in Salesforce Go saves you time and simplifies the process by automating several steps.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with the Agentforce SDR add-on. Setup for agents is available on the desktop site.

Why: The guided setup process reduces the number of steps and lets you configure and test your agent all in one place. Setup takes care of tasks like creating a user record for the agent, assigning it permissions, and configuring Einstein Activity Capture.

How: From Salesforce Go, click **Agentforce for Sales** and follow the instructions.

Scale Up Lead Nurturing Activity with Automatic Limit Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Agentforce now manages the Lead Nurturing prospect outreach queue automatically so that agents can nurture large numbers of prospects simultaneously while respecting email send and LLM request limits.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Sales Cloud and the Agentforce Lead Nurturing add-on. Setup for agents is available on the desktop site.

Why: Previously there was a maximum number of prospects assignments per day. Now, users can keep adding prospects while Agentforce manages the queue automatically. The queue gives highest priority to reply emails, then intro emails and nudges.

Build Pipeline Faster by Assigning Prospects to Agentforce Lead Nurturing in Bulk

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Users can now assign up to 200 prospects at once to a Lead Nurturing agent from list views. Agentforce adds assignments that exceed email send or LLM limits to a managed queue that's visible in the Agent Command Center. Previously, you could only assign records one at a time or by using assignment rules in the agent configuration. Adding more than 30 prospects at a time sometimes caused an error. The managed queue eliminates these errors.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Sales Cloud and the Agentforce Lead Nurturing add-on. Setup for agents is available on the desktop site.

Why: Users can assign up to 200 prospects at once from list views. Agents that use a Gmail account can have a maximum of 25200 prospects assigned. Agents that use an Outlook account can have a maximum of 137200 prospects assigned.

Control and Customize Agent Behavior Faster with Modular Topics and Actions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now directly view and modify each step of the Lead Nurturing agent workflow, eliminating the need for complex prompt engineering. In Agentforce Builder, the agent's logic appears as discrete, configurable topics and actions that are easy to navigate and edit.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Sales Cloud and the Agentforce Lead Nurturing add-on. Setup for agents is available on the desktop site.

Why: For example, you could easily update the Return Calendar Link action to use a custom link for booking meetings.

How: In Agent Builder, find the Return Calendar Link action and insert your custom link. The agent will immediately begin using it for all meeting requests.

Agentforce Sales Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create and deploy agents to help your reps throughout the sales process. Now, Agentforce helps you with account research, meeting prep, and account briefs. And, streamline follow-up tasks with post-meeting suggestions. Save time and effort on configuration with Pipeline Management setup in Salesforce Go. Use Agentforce in Slack to manage both deals and accounts from the familiar Slack interface.

[Move Deals Forward with Post-Meeting Suggestions from Agentforce](#)

Agentforce Pipeline Management now offers sellers post-meeting suggestions to streamline follow-up tasks. By analyzing conversation transcripts from video and voice calls, the Sales Management agent can recommend sending follow-up emails or meeting requests, and help draft those communications. Sellers can review and approve the suggestions to ensure prompt and personalized communication with prospective customers.

[Experience a Faster Agentforce Pipeline Management Setup](#)

Guided setup consolidates your pipeline management settings into a single location and automates several configuration steps, saving you time and effort. Setup in Salesforce Go replaces the setup

experience for Agentforce Pipeline Management.

Streamline Account Research and Strategy with Agentforce Account Management

Use Agentforce Account Management to conduct deep research on accounts, build strategic positioning statements, and prepare for sales team meetings. Create comprehensive briefings with company demographics, business priorities, key performance indicators (KPIs), industry trends, and more to anchor your entire sales strategy. When you save time with Agentforce Account Management, you can focus more on what really matters: building strong relationships with customers.

Accelerate Sales Workflows with Agentforce Pipeline Management and Agentforce Account Management in Slack

Agentforce Pipeline Management and Agentforce Account Management now operate within Slack to proactively assist sellers throughout the entire deal cycle, from account research and meeting preparation to choosing next actions and keeping opportunities updated. Build pipeline, close deals, and grow your accounts, all from within Slack.

Move Deals Forward with Post-Meeting Suggestions from Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Agentforce Pipeline Management now offers sellers post-meeting suggestions to streamline follow-up tasks. By analyzing conversation transcripts from video and voice calls, the Sales Management agent can recommend sending follow-up emails or meeting requests, and help draft those communications. Sellers can review and approve the suggestions to ensure prompt and personalized communication with prospective customers.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with Foundations and the Agentforce for Sales or Agentforce for an Industry add-on license, or included in Agentforce 1 Sales or an Industry Edition. Requires each user to have the Agentforce for Sales or Agentforce for an Industry add-on to access the actions.

When: Post-meeting suggestions in Agentforce Pipeline Management became available in late November 2025.

How: If you're turning on Agentforce Pipeline Management for the first time, from the gear icon, select **Salesforce Go**. On the Salesforce Go Home page, search for Agentforce for Sales. Turn on **Pipeline Management** and complete the steps.

If Agentforce Pipeline Management is already on and you've configured a Sales Management agent, add the Communicate with Customers topic and its actions to your agent. Make sure that Einstein Conversation Insights and Inbox are turned on and configured. After completing these steps, we recommend using the Sales Management User permission set group to assign users access to the

feature, instead of the Use Agentforce Pipeline Management permission set. Using the permission set group makes it easier to grant access in case future updates require additional permissions or permission sets.

When you turn on Sales Workspace, it replaces the traditional Seller Home to provide a smarter, more proactive daily selling experience.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Agentforce 1 Sales editions with the Salesforce Foundation add-on.

When: Sales Workspace is available in Sales Cloud starting December 2025.

How: From the gear menu, select **Salesforce Go**, and then search for Sales Workspace. Turn on Sales Workspace and complete the steps.

Einstein Conversation Insights

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get your generative AI features bundled together with Generative ECI, which combines the call summary and generative conversation insight capabilities under a single feature. We're also making speedy call processing more widely available with Vendor Transcript Processing. If you have Salesforce 1 Sales Edition, access deal closing recaps. More ECI data is available on the Salesforce Platform. Your sales teams can use call transcripts from Gong with ECI. And we've improved participant matching for Microsoft Teams video calls.

Use Call Summaries and Generative Insights Across All Calls with Generative ECI

We're combining the call summary and generative conversation insight features together with Generative ECI. The feature works across both voice and video calls, is available to all users without additional licenses, and is automatically enabled for orgs using generative AI features.

Accelerate Transcription and Insights with Vendor Transcripts

With Vendor Transcript Processing, your sales teams can quickly access call summaries and critical call insights. Sales managers can quickly deliver coaching tips to their reps and see how they're doing. Existing ECI customers can toggle the feature on. New customers have it auto-enabled and can't turn it off.

Understand Why You Win or Lose with Opportunity Closing Recaps

Replace unstructured manual notes with generative AI-powered deal recaps. Unlock scalable sales intelligence and trend analysis by automatically generating a detailed closing recap that captures the specific drivers behind deal outcomes, such as pricing, competitors, or product gaps.

Einstein Conversation Insights Data Is Now Native to the Salesforce Platform

Einstein Conversation Insights (ECI) data for new customers is now stored natively on the Salesforce Platform. For existing ECI customers, data migration to the Salesforce Platform is scheduled to begin in Summer '26.

Take Advantage of Improved Participant Matching

We've improved participant matching for Microsoft Teams video calls. You no longer need your email matched to your data source. We're more effectively using calendar and meeting data to get email participant info, so matching for these calls works better automatically.

Use Call Transcripts from Gong

You can now use call transcripts from Gong with Einstein Conversation Insights. Connect with Gong to get call summaries, insights, and other ECI features. You can also import transcripts created before Gong was connected.

Use Call Summaries and Generative Insights Across All Calls with Generative ECI

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

We're combining the call summary and generative conversation insight features together with Generative ECI. The feature works across both voice and video calls, is available to all users without additional licenses, and is automatically enabled for orgs using generative AI features.

Where: This feature requires Einstein Conversation Insights and is available in Lightning Experience in Enterprise, Performance, Unlimited, and Agentforce 1 Sales editions. Einstein generative AI is available in Lightning Experience.

Who: This feature is available to users with access to Einstein Conversation Insights.

Why: Get call summaries automatically for all ECI calls. A standard call summary includes the summary itself, the customer impression, and any next steps.

Video Call
TrailTech Discussion

Call Started: 9/7/2023, 10:21 AM | Call Duration: 00:35:24 | Language: English | Call Type: Google Meet | Related Record: Adventure for Life | Owner Name: Alex Zhang

Meeting Playback

Participants

- Customer: Adventure for Life (Gabriela Silva)
- Internal Reps: Northern Trail (Alex Zhang)

Insights

- Automatic Insights: Questions (2), Pricing (2), Next Steps (3), Challenges (1)
- Objections: Budget (1), Authority (1)
- Competitors: Peak Systems (3)

Call Summary (Created by Einstein)

Customer Impression
The customer seemed satisfied with the call and appreciated the assistance provided by the seller. They expressed gratitude and ended the call on a positive note.

Call Summary
During the call, Alex Zhang from Northern Trail presented the benefits of TrailTech, highlighting its features, customization options, and automation capabilities, while also acknowledging Peak Systems' advantage in coaching. Both parties discussed the potential benefits of TrailTech for Adventure for Life's sales operations. Gabriella Silva was particularly interested in feature gap comparison between TrailTech and Peak Systems to make an informed decision for her company.

Next Steps
• Customer to review the information provided and discuss with the team

Admins can also create custom insights for their video calls. Using generative AI, get answers to things such as customer sentiment or deal terms surfaced for sales conversations automatically. We've increased the limit of available generative insights to eight.

Owner Name
Kevin Harris

Follow up

Generative Insights (Created by Einstein)

What were the deal terms on this call?
During the call, the deal terms under deliberation encompassed a comprehensive range of aspects. These included intricate discussions on pricing structures, outlining clear payment milestones to facilitate a smooth financial progression, and delineating the specific contractual obligations each party would undertake. The aim was to meticulously craft an agree... [More](#)

What was the customer sentiment on this call?
Throughout the call, the customer sentiment was distinctly positive. The client conveyed a sense of satisfaction and appreciation, particularly in response to the proposed solutions and strategies discussed, a genuine interest in the potential collaboration and a belief in the value that could be derived from the partnership. Overall, the atmosphere was constructive and optimistic, laying a solid foundation for future interactions. The client was... [More](#)

Will this deal close in this quarter?
While it's always challenging to predict with certainty, the discussions and the shared enthusiasm suggest a promising outlook for closing the deal within this quarter. Both sides have

How: Generative ECI is automatically enabled for orgs already using Call Summaries or Generative Conversation Insights.

From Salesforce Go, enter *Einstein Conversation Insights* under Features. Then enable **Generative ECI**.

No new permission sets are required. References to Call Summary and Generative Insights are no longer available in Setup.

Accelerate Transcription and Insights with Vendor Transcripts

This release is in preview

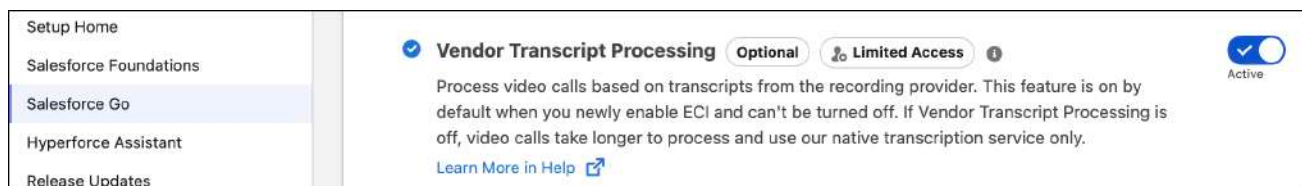

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Vendor Transcript Processing, your sales teams can quickly access call summaries and critical call insights. Sales managers can quickly deliver coaching tips to their reps and see how they're doing. Existing ECI customers can toggle the feature on. New customers have it auto-enabled and can't turn it off.

Where: This change applies to Einstein Conversation Insights in Lightning Experience. Einstein Conversation Insights is available in Enterprise, Performance, Unlimited, and Agentforce 1 Sales editions.

Why: Use vendor transcripts for video call processing instead of our native transcription service to speed up processing time.

How: Vendor Transcript Processing is on by default for orgs newly enabling Einstein Conversation Insights. The feature can't be turned off after it's enabled.

To enable Vendor Transcript Processing, from Salesforce Go, enter *Einstein Conversation Insights* under Features. Then enable **Vendor Transcript Processing**.

Understand Why You Win or Lose with Opportunity Closing Recaps

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Replace unstructured manual notes with generative AI-powered deal recaps. Unlock scalable sales intelligence and trend analysis by automatically generating a detailed closing recap that captures the specific drivers behind deal outcomes, such as pricing, competitors, or product gaps.

Where: This change applies to Einstein Conversation Insights only in Agentforce 1 Sales Edition. To purchase Agentforce 1 Sales Edition, contact your Salesforce account executive.

Who: This feature applies to all opportunities. Data is viewable to users with the Deal Recap Standard User permission set and access to the specific opportunity.

Why: Deal recap provides a deeper understanding of your pipeline health by transforming unstructured opportunity data, conversation insights, and so on, into actionable data. By automatically compiling conversation and activity details into structured deal recaps, sales reps save time while capturing specific drivers behind deal outcomes. With this structured approach, managers gain instant clarity on individual deals, and sales leaders can identify and act on trends across the entire organization.

How: From Setup, select **Salesforce Go**. Then search for the Einstein Conversation Insights feature. Scroll down to find Unlock Advanced Functionality with Generative AI and turn on **Unified Sales Intelligence**.

Einstein Conversation Insights Data Is Now Native to the Salesforce Platform

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Einstein Conversation Insights (ECI) data for new customers is now stored natively on the Salesforce Platform. For existing ECI customers, data migration to the Salesforce Platform is scheduled to begin in Summer '26.

Where: This change applies to Einstein Conversation Insights in Lightning Experience. Einstein Conversation Insights is available in Enterprise, Performance, and Unlimited editions and as an add-on in Enterprise Edition for more than 10 users.

When: Starting in January 2026, standard Salesforce objects for ECI are turned on by default for all new customers. Data stored in these records count toward your organization's data storage capacity.

Note Analytics for Conversation Insights is scheduled for retirement in Summer '26. See [Analytics Dashboard for Einstein Conversation Insights Upcoming Retirement \(Summer '26\)](#).

Who: This change applies immediately to new customers who turn on Einstein Conversation Insights for the first time.

Why: With ECI data stored in Salesforce objects, you can now:

- Reference conversation data directly in your CRM automations with tools like Flow, Apex, and Prompt Builder to create alerts, update records, and trigger actions based on specific conversation insights.
- Query and report on conversation data by using standard Salesforce tools. Run models, draw new inferences, and extract valuable intelligence to guide your sales organization.

Take Advantage of Improved Participant Matching

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

We've improved participant matching for Microsoft Teams video calls. You no longer need your email matched to your data source. We're more effectively using calendar and meeting data to get email participant info, so matching for these calls works better automatically.

Where: This change applies to Einstein Conversation Insights in Lightning Experience. Einstein Conversation Insights is available in Enterprise, Performance, Unlimited, and Agentforce 1 Sales editions.

How: Improved participant matching and related record matching is automatically available to Einstein Conversation Insights users that use Microsoft Teams for calls.

Use Call Transcripts from Gong

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now use call transcripts from Gong with Einstein Conversation Insights. Connect with Gong to get call summaries, insights, and other ECI features. You can also import transcripts created before Gong was connected.

Where: This change applies to Einstein Conversation Insights in Lightning Experience. Einstein Conversation Insights is available in Enterprise, Performance, Unlimited, and Agentforce 1 Sales editions.

How: To integrate with Gong, from Salesforce Go, enter *Einstein Conversation Insights* under Features. In the **Connect with Gong** section, click **Set Up** and follow the steps provided to install the managed package.

Sales Programs and Partner Tracks with Enablement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Drive revenue growth for sales territories, and manage users for your Enablement programs efficiently.

Enablement

Optimize your sales territory performance and easily remove multiple users from your Enablement program.

Enablement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Optimize your sales territory performance and easily remove multiple users from your Enablement program.

Scale Enablement to More Users with Streamlined Setup Experience

Discover and set up Enablement for your sales teams in a unified experience with Salesforce Go. Assign permissions directly in Salesforce Go, and monitor usage to ensure users are getting the most

out of Enablement.

Boost Sales Performance in Your Territories with Enablement Programs

Provide sales teams in your territories targeted training and relevant resources through Enablement programs. Bulk assign users to a program based on the users' roles. When you assign territory roles to a program, users with those roles are automatically assigned to the program. Previously, you manually assigned individual territory users to an Enablement program.

Remove Multiple Users from Enablement Programs Efficiently

Save time and effort while removing users from your Enablement programs. With the automated bulk user removal flow, you can filter and remove a large number of users from your programs with less manual work. Previously, you could remove only one user at a time from a program.

Prebuilt ECI Measures Aren't Available with the New ECI Setup for Enablement

If you set up ECI for Enablement in Spring '26, the prebuilt ECI measures aren't available to your sales teams. Teams that have ECI configured in earlier releases can continue to access ECI measures.

Scale Enablement to More Users with Streamlined Setup Experience

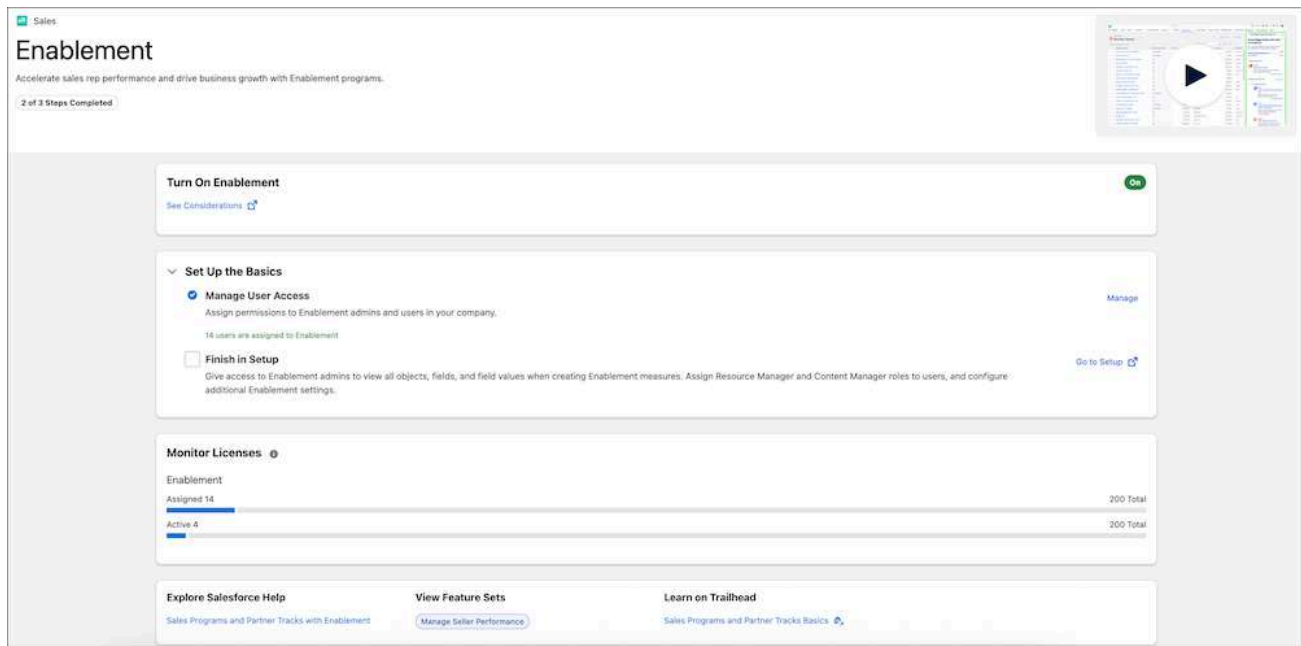

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Discover and set up Enablement for your sales teams in a unified experience with Salesforce Go. Assign permissions directly in Salesforce Go, and monitor usage to ensure users are getting the most out of Enablement.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, Einstein 1 Sales, and Developer editions with Sales Cloud, Service Cloud, or Salesforce Platform. An Enablement add-on license is required.

How: Select **Salesforce Go** from the gear menu or from the main Setup menu. To find and set up Enablement, go to the Features tab or search for Enablement.

Sales Performance Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Refine territory design in complex markets by assigning shared boundaries to multiple sales areas. Distribute financial targets directly to accounts while accounting for existing bottom-up goals. Plus, streamline the sales planning process by generating quota plans based on territory alignments to keep data synchronized.

Salesforce Maps and Salesforce Maps Advanced

Map crucial proprietary and third-party data when you integrate it with your Salesforce data. Reveal sales opportunities on partner sites. And visualize planned field visits compared with past visit metrics.

Sales Planning

Create quota plans from territory hierarchy, owner, and attribute data within sales plan segments. Design territories with current Salesforce data. And distribute work fairly among sales teams that don't rely on geographic boundaries.

Salesforce Maps and Salesforce Maps Advanced

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Map crucial proprietary and third-party data when you integrate it with your Salesforce data. Reveal sales opportunities on partner sites. And visualize planned field visits compared with past visit metrics.

Sales Planning

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create quota plans from territory hierarchy, owner, and attribute data within sales plan segments. Design territories with current Salesforce data. And distribute work fairly among sales teams that don't rely on geographic boundaries.

Design Territories with Shared Boundaries

Refine your territory design in densely populated areas by allowing a single boundary, such as a postal code, to be assigned to multiple sales areas. This new capability is supported only for live data alignments and gives you more customization when modeling complex geographic territories like New York City or London. Units, however, can still only be assigned to a single area. Utilize area-level assignment rules to ensure units are correctly mapped when areas overlap.

Allocate Financial Targets to Accounts in Territory Planning

Distribute top-down financial targets directly to accounts within Territory Planning. You can split targets evenly, weight them based on criteria like annual revenue, or distribute by defined segments. To ensure realistic planning, the allocation logic respects existing bottom-up targets set by the field. This alignment simplifies the transition from territory design to quota planning.

Enjoy Improved Performance in Territory Planning

Create territories for your sales teams with confidence, efficiency, and trust. Territory Planning provides enhanced security, reliable scalability, and better performance for some resource-intensive functionality.

Create Alignment-Based Quota Plans

Streamline the planning process by creating quota plans directly from existing territory alignments. Planners can now view account-level details and metadata within the quota planning interface to inform target setting. Because the plans share data, updates to territory models flow into the quota plan, ensuring assignments and targets remain synchronized.

Sales Planning Version 1 is Scheduled for Retirement

Sales Planning version 1 is scheduled for retirement in Summer '26.

Design Territories with Shared Boundaries

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Refine your territory design in densely populated areas by allowing a single boundary, such as a postal code, to be assigned to multiple sales areas. This new capability is supported only for live data alignments and gives you more customization when modeling complex geographic territories like New York City or London. Units, however, can still only be assigned to a single area. Utilize area-level assignment rules to ensure units are correctly mapped when areas overlap.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional, Enterprise, Performance, Unlimited, and Developer editions with Web Services API enabled.

How: Admins and users can enable overlapping boundaries through several methods in the boundary legend. To use the new Assign to Multiple Areas action, select boundaries, choose the action, select multiple areas from the picklist, then select Preview and Confirm your changes. Alternatively, you can inline edit the assignment field in the boundary legend by selecting multiple areas from the list of area names.

The image consists of two screenshots of the Salesforce Maps Territory Planning interface, illustrating the 'Assign to Multiple Areas' action.

Top Screenshot: The 'Legend' tab is active, showing a list of US states. A red box highlights the 'Assign to Multiple Areas' button in the legend's action menu. The 'Units selected' dropdown shows '3'.

Bottom Screenshot: The 'Assign to Multiple Areas' dialog is open, showing a list of areas. The 'Areas' dropdown is set to 'Territory 1, Territory 2, Territory 3'. The 'Units selected' dropdown shows '3'.

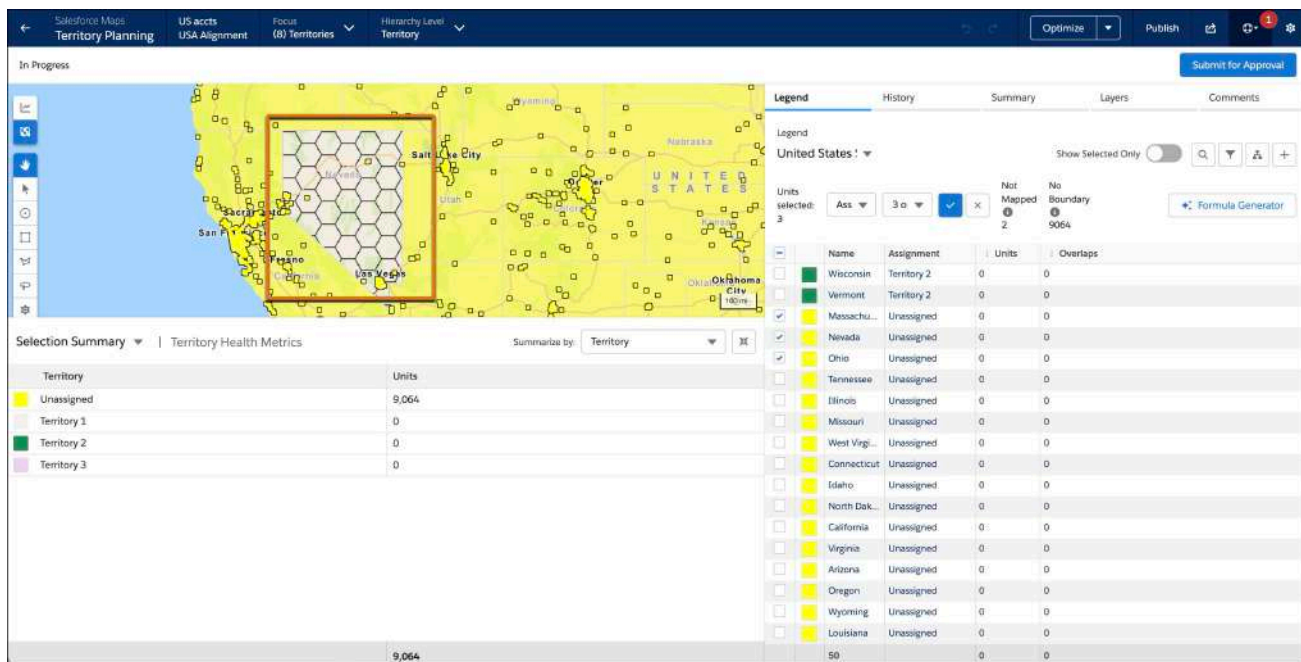

Selection Summary Table (Territory Health Metrics):

Territory	Units
Unassigned	9,064
Territory 1	0
Territory 2	0
Territory 3	0

Legend Table (United States):

State	Assigned	Units	Overlaps
Nevada	Unassigned	0	0
Ohio	Unassigned	0	0
Tennessee	Unassigned	0	0
Illinois	Unassigned	0	0
Missouri	Unassigned	0	0
West Virg.	Unassigned	0	0
Connecticut	Unassigned	0	0
Idaho	Unassigned	0	0
North Dak.	Unassigned	0	0
California	Unassigned	0	0
Virginia	Unassigned	0	0
Arizona	Unassigned	0	0
Oregon	Unassigned	0	0
Wyoming	Unassigned	0	0
Louisiana	Unassigned	0	0
Total	50	0	0

To modify overlapping areas independently or to enable optimization (which is disabled when overlapping boundaries are in focus), use the Set Focus action to temporarily remove overlapping areas from the map. Boundaries that overlap are denoted by a hexagonal "honeycomb" pattern on the map and in the boundary legend.

Allocate Financial Targets to Accounts in Territory Planning

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Distribute top-down financial targets directly to accounts within Territory Planning. You can split targets evenly, weight them based on criteria like annual revenue, or distribute by defined segments. To ensure realistic planning, the allocation logic respects existing bottom-up targets set by the field. This alignment simplifies the transition from territory design to quota planning.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional, Enterprise, Performance, Unlimited, and Developer editions with Web Services API enabled.

How: Configure a goal within an alignment connected to a segment data source to enable allocation options. Use an allocation formula to distribute targets using even, weighted, or bucketed methods, while automatically subtracting any existing bottom-up targets from the total. You can also import overrides or publish targets to use them in downstream quota planning.

Enjoy Improved Performance in Territory Planning

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create territories for your sales teams with confidence, efficiency, and trust. Territory Planning provides enhanced security, reliable scalability, and better performance for some resource-intensive functionality.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional, Enterprise, Performance, Unlimited, and Developer editions with Web Services API enabled.

How: When you optimize a territory plan, the job now runs on Hyperforce, the Salesforce public cloud infrastructure with integrated standards for compliance, security, agility, and scalability.

And, when you publish territories to Salesforce Field Service, the job that generates KML files runs more efficiently. However, in some limited geographies, viewing these published territories in Field Service can cause a slight degradation of shapes.

Create Alignment-Based Quota Plans

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Streamline the planning process by creating quota plans directly from existing territory alignments. Planners can now view account-level details and metadata within the quota planning interface to inform target setting. Because the plans share data, updates to territory models flow into the quota plan, ensuring assignments and targets remain synchronized.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional, Enterprise, Unlimited, and Developer editions with Sales Planning in English only and with Web Services API enabled.

Why: Planning traditionally relies on assumptions that shift rapidly as deals close or account rosters change, which can force teams back into planning cycles. By linking quota plans to territory alignments, Sales Operations can maintain control over data updates while validating plans against the latest hierarchy and assignment structures. This integration provides visibility into account-specific metadata, such as historical revenue, helping to balance quotas fairly even when territory structures are complex or shifting.

How: Select a territory alignment when creating a new quota plan to import the area hierarchy and account data. The hierarchy remains read-only within the quota plan to preserve the territory structure, but you can view account details and allocate targets based on the imported areas. If the source territory changes, such as a deleted area, the system flags the mismatch and prompts you to accept changes to keep the plans aligned.

Sales Planning Version 1 is Scheduled for Retirement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Sales Planning version 1 is scheduled for retirement in Summer '26.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional, Enterprise, Unlimited, and Developer editions with Sales Planning in English only and with Web Services API enabled.

Email, Calendar, and Integrations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Adopt authorized email domains. Accurately monitor event and email syncing with detailed insights and reports. Capture and report on email as an activity with the Sync Email as Salesforce Activity feature. Prepare for the retirement of Exchange Web Services and its impact on email-related features and products. Salesforce for Outlook retires in December 2027.

Email Configuration

If you previously worked with Salesforce Customer Support to disable email change verifications, set up authorized email domains instead.

Einstein Activity Capture

Accurately monitor event and email syncing with detailed insights and reports on failure. Extend the scope of your Account, Contact, Opportunity, and Lead reports by integrating detailed email insights in

your reports.

Lightning Sync for Microsoft® Exchange

Microsoft announced the retirement of Exchange Web Services (EWS) starting October 1, 2026. Lightning Sync configurations that use EWS won't capture or sync data from Microsoft after EWS is retired.

Salesforce for Outlook (Retiring)

Full product retirement for Salesforce for Outlook is scheduled for December 2027. If you're sticking with Salesforce for Outlook for now, you can access past release notes about the current version from the Trailblazer Community.

Outlook Integration

Outlook Integration replaces Salesforce for Outlook and gives users new capabilities, like the use of Agentforce for emails.

Gmail Integration

Get immediate access to relevant CRM data alongside your email communication by accessing the Gmail integration directly within Sales Cloud Everywhere.

Salesforce Inbox

Check out the latest improvements to Salesforce Inbox.

Email Configuration

If you previously worked with Salesforce Customer Support to disable email change verifications, set up authorized email domains instead. Salesforce is retiring the existing exemption process for disabling this feature, and authorized email domains provide the same benefit. This update is available starting in Spring '26.

Where: This change applies to Lightning Experience, Salesforce Classic, and the Salesforce mobile app in all editions.

When: Salesforce enforces this update in Winter '27. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your My Domain name or instance, and click the maintenance tab.

Why: The process to disable email change verification relied on a manual change by Salesforce Customer Support, which created operational inefficiencies and potential risks. With authorized email domains, you simplify the onboarding process for new users by using domain-level email verification. Email verification is bypassed for users with email addresses on a domain that you trust.

Note These changes relate to the verification of email addresses stored in Salesforce and the ability to send email from Salesforce. There's no change to the requirements for account verification for access to Salesforce.

How: To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Adopt Authorized Email Domains, follow the testing and activation steps.

Einstein Activity Capture

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Accurately monitor event and email syncing with detailed insights and reports on failure. Extend the scope of your Account, Contact, Opportunity, and Lead reports by integrating detailed email insights in your reports.

[Migrate Microsoft 365 Authentication in Einstein Activity Capture to Microsoft Graph](#)

Transition your Einstein Activity Capture's Microsoft 365 authentication from Exchange Web Services

(EWS) to Microsoft Graph, which is more modern, secure, and scalable. Microsoft is retiring EWS in October 2026, so switch to Microsoft Graph to avoid service disruption. Proactive notifications and a single-click tool make the migration process smooth.

Include Email Insights in Custom Report Types

Extend the scope of your Account, Contact, Opportunity, and Lead reports by integrating detailed email insights such as message type and content in your reports. Insights like these provide a more holistic view of your sales activities and help you stay on top of important customer communications.

Monitor Accurate Event and Email Sync with Detailed Metrics and Failure Reports

Get clear insights into event and email sync status with accurate metrics. For example, identify and resolve setup issues more effectively and improve user trust with sync failure reports.

Make Captured Emails Available as Activity Data by Updating Einstein Activity Capture

Use an option in Setup to update Einstein Activity Capture and migrate previously captured email to Salesforce activity data. With this update and migration, all new email data and previously captured email data are synced, stored, and available as activity data. This update and migration makes email data available to platform tools and operations. After you start the update and migration process, it runs and is completed automatically.

Synced Calendar Overlay Is Retiring

If Show Synced and Captured Events is turned on, Einstein Activity Capture users access a view-only copy of events from Microsoft or Google on their Calendar. Some customers mistook the view-only events as duplicate calendar entries, so we're retiring this feature.

Prepare for Activity 360 Reporting, Activity Metrics, and Activities Analytics Dashboard Retirement

Before these tools retire, we recommend turning on Sync Email as Salesforce Activity for Einstein Activity Capture and configuring reports to explore data captured from email.

Migrate Microsoft 365 Authentication in Einstein Activity Capture to Microsoft Graph

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Transition your Einstein Activity Capture's Microsoft 365 authentication from Exchange Web Services (EWS) to Microsoft Graph, which is more modern, secure, and scalable. Microsoft is retiring EWS in October 2026, so switch to Microsoft Graph to avoid service disruption. Proactive notifications and a single-click tool make the migration process smooth.

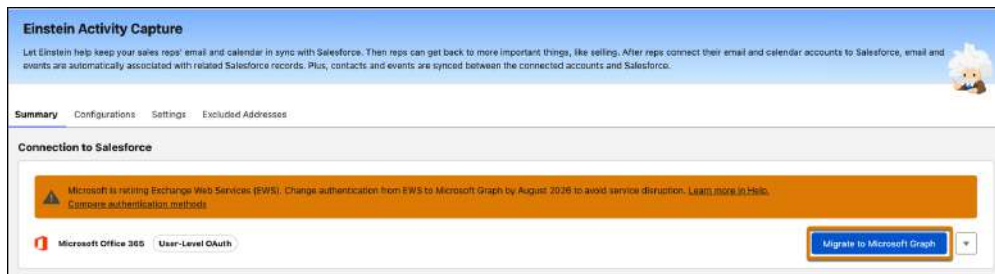

Where: This feature is available in Lightning Experience in Starter, Professional, Enterprise, Unlimited, Einstein 1 Sales, and Agentforce 1 Sales editions. It's also available with the Einstein for Sales, Sales Engagement, and Revenue Intelligence add-ons.

When: This feature is available starting in February 2026.

Who: The update is available if Einstein Activity Capture is configured to use Microsoft 365. If you're setting up Einstein Activity Capture with Microsoft 365 starting in Spring '26, you're automatically authenticated by using Microsoft Graph.

Why: This migration is essential to align with Microsoft's evolving security standards and to avoid potential disruptions as EWS reaches its end of life in October 2026. By transitioning to Microsoft Graph, Salesforce makes sure that your organization remains compliant and competitive, with improved support for modern features and enhanced user-level authentication.

How: Before and during migration, make sure that your Azure admin has granted Microsoft Graph consent. Then, use the single-click migration tool to complete the migration and select the correct authentication method.

If Einstein Activity Capture is configured to use User-Level OAuth, users must reconnect to their Microsoft 365 accounts to complete the connection migration.

Make Captured Emails Available as Activity Data by Updating Einstein Activity Capture

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use an option in Setup to update Einstein Activity Capture and migrate previously captured email to

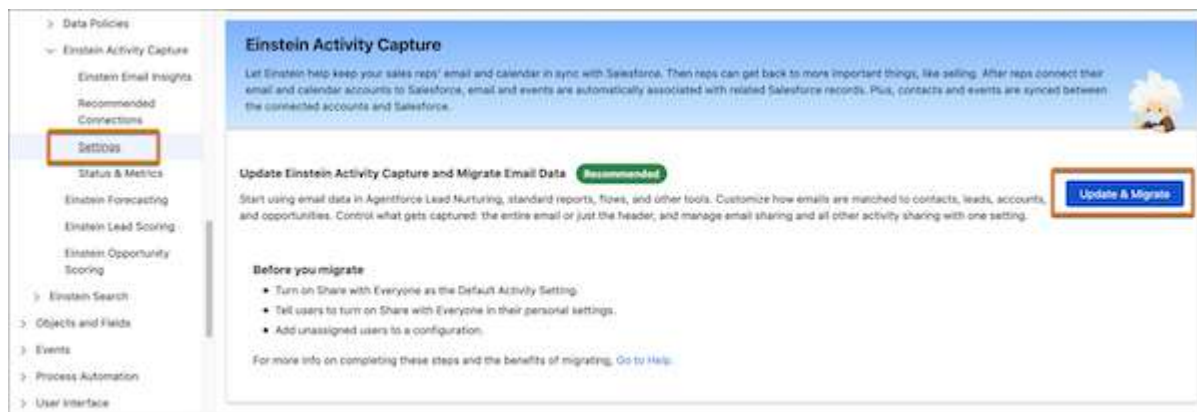

Salesforce activity data. With this update and migration, all new email data and previously captured email data are synced, stored, and available as activity data. This update and migration makes email data available to platform tools and operations. After you start the update and migration process, it runs and is completed automatically.

Where: This feature is available in Lightning Experience in Starter, Professional, Enterprise, Unlimited, Einstein 1 Sales, and Agentforce 1 Sales editions. It's also available with the Einstein for Sales, Sales Engagement, and Revenue Intelligence add-ons.

When: This tool rolls out as a staggered release beginning late December 2025 in sandboxes and early 2026 in production.

Who: This is available if Einstein Activity Capture is set up without Sync Email as Salesforce Activity. If you've set up Sync Email as Salesforce Activity, you don't need to update or migrate.

Why: Updating Einstein Activity Capture turns on Sync Email as Salesforce Activity for all newly captured email and migrates previously captured email to activity data. Email synced as activity data is stored in EmailMessage and Task object records, making it available to platform reports, automation, and APIs. It also offers more granular privacy and sharing settings for captured email data. Previously, captured email data wasn't stored in standard objects or available to platform tools and required unique reports to access and analyze the data. Sync Email as Salesforce Activity was introduced as a default setting for Einstein Activity Capture in Summer '25.

Synced Calendar Overlay Is Retiring

This release is in preview

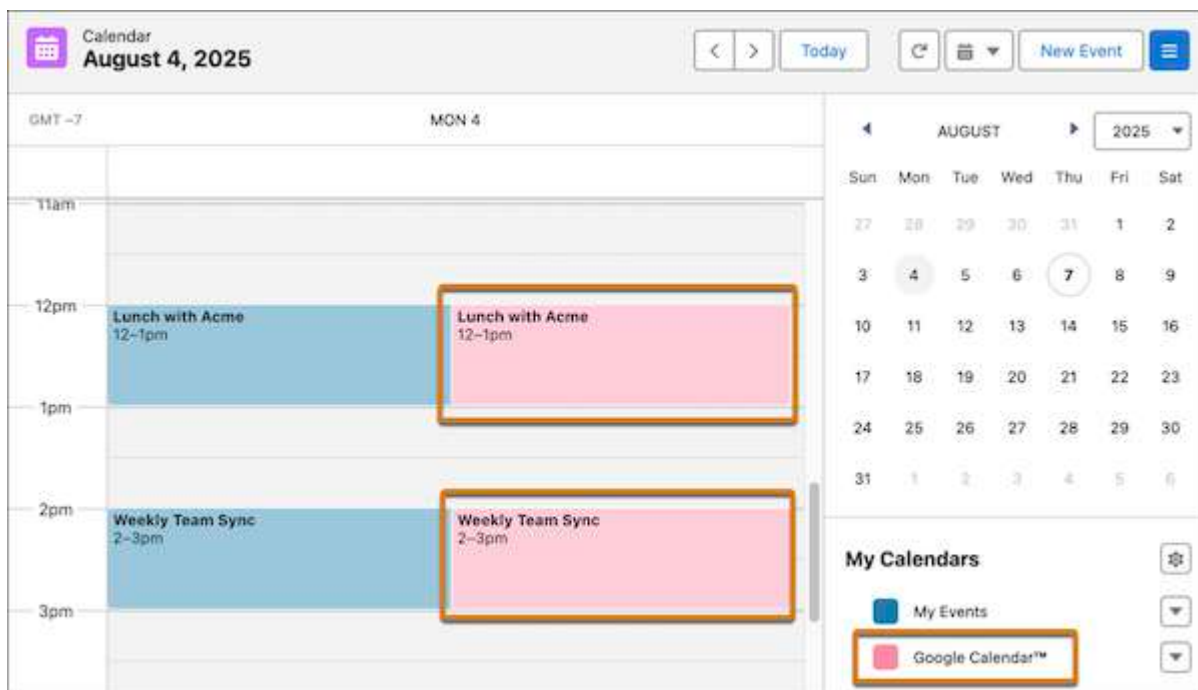

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

If Show Synced and Captured Events is turned on, Einstein Activity Capture users access a view-only copy of events from Microsoft or Google on their Calendar. Some customers mistook the view-only events as duplicate calendar entries, so we're retiring this feature.

Where: This feature is available in Lightning Experience in Starter, Professional, Enterprise, Unlimited, Einstein 1 Sales, and Agentforce 1 Sales editions. It's also available with the Einstein for Sales, Sales Engagement, and Revenue Intelligence add-ons.

When: The view-only calendar overlay and the Synced and Captured Events setting in Einstein Activity Capture is retiring. They're no longer available unless previously turned on. If you turn it off, you can't re-enable it.

Prepare for Activity 360 Reporting, Activity Metrics, and Activities Analytics Dashboard Retirement

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Before these tools retire, we recommend turning on Sync Email as Salesforce Activity for Einstein Activity Capture and configuring reports to explore data captured from email.

Where: Activity 360 Reporting, Activity Metrics, and Activities Analytics Dashboard are available in Lightning Experience in Starter, Professional, Enterprise, Unlimited, Einstein 1 Sales, and Agentforce 1 Sales editions. They're also available with the Einstein for Sales, Sales Engagement, and Revenue Intelligence add-ons.

Why: Starting in Summer '25, Einstein Activity Capture can sync and store email data as Task and EmailMessage object records. With this new data structure you can explore and use email activity data with standard reports, SOQL, automation workflows, and APIs. Activity 360 Reporting, Activity Metrics, and Activities Analytics Dashboard aren't available unless previously turned on. Additionally, data from these reporting tools that appears in other features, including Prospecting Center, Pipeline Inspection, and Einstein Conversation Insights, aren't available unless previously configured. This change affects other features that use Einstein Activity Capture data, including Prospecting Center, Pipeline Inspection, and Einstein Conversation Insights. Objects related to Activity 360 Reporting data are also scheduled to retire: UnifiedEmail, UnifiedEmailParticipant, UnifiedMeeting, UnifiedMeetingParticipant, UnifiedTask, and UnifiedTaskParticipant.

How: To turn on Sync Email as Salesforce Activity, update Einstein Activity Capture and migrate previously captured email. Use the Update & Migrate option available in Setup. Sync Email as Salesforce Activity is enabled by default if you turned on Einstein Activity Capture in Summer '25 or later.

Check out the latest improvements to Salesforce Inbox.

Migrate Microsoft 365 Authentication in Inbox to Microsoft Graph

Transition your Inbox's Microsoft 365 authentication method from Exchange Web Services (EWS) to Microsoft Graph, which is more modern, secure, and scalable. Microsoft is retiring EWS in October 2026, so switch to Microsoft Graph to avoid service disruption.

Simplify Meeting Scheduling with a Redesigned Interface

Give prospects a simpler and quicker way to schedule meetings with your sales team. When a user receives a scheduling link generated from Insert Availability in the Lightning Experience Email Composer, Gmail extension, or Outlook add-in, they're taken to the new interface.

Migrate Microsoft 365 Authentication in Inbox to Microsoft Graph

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Salesforce CMS

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Previously known as Sidebar Extensions, Extensions in CMS have an improved development workflow. Build extensions to add more productivity tools to your CMS content workflow, such as third-party generative AI tools or tone and grammar editors. When you work with external content providers, you can now choose which providers are available to your workspace and where to save files from these systems.

Create Content More Efficiently by Using Improved Extensions in Salesforce CMS

Add more productivity features to your content workflow, such as third-party generative AI tools, tone and grammar editors, and translators with Extensions in CMS. Formerly known as Sidebar Extensions, Extensions now appear in a floating panel in the content editor. Use the new development workflow to build more complex extensions for specific content types, and customize the size and behavior of the floating panel.

Take Control of Assets from External Content Providers

Several new settings make it easier to manage external assets in an enhanced CMS workspace. Choose which providers are available to your workspace for greater administrative control, and specify where to save the files. Previously, you could only save external assets directly in the workspace, but now you can choose your preferred folder.

Create Content More Efficiently by Using Improved Extensions in Salesforce CMS

This release is in preview

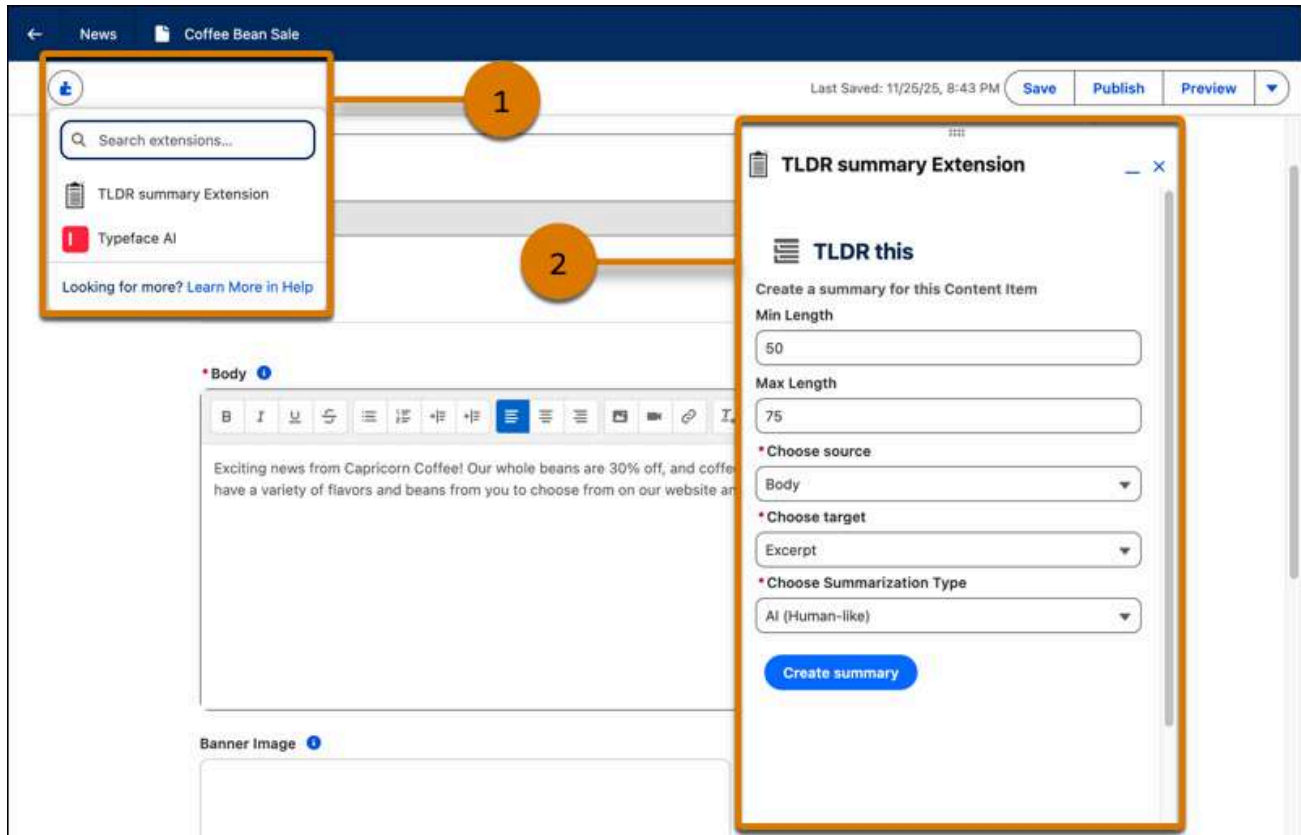

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Add more productivity features to your content workflow, such as third-party generative AI tools, tone and grammar editors, and translators with Extensions in CMS. Formerly known as Sidebar Extensions, Extensions now appear in a floating panel in the content editor. Use the new development workflow to build more complex extensions for specific content types, and customize the size and behavior of the floating panel.

Where: This change applies to enhanced CMS workspaces in Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

How: To build new extensions for specific content types, use the new development workflow. Any extension built with the existing workflow still works as expected. To test the appearance of existing

extensions in the new floating panel, open them in the content editor.

To use an extension while editing CMS content, select one from the extensions menu (1). Work with the extension in the floating panel (2) and apply your changes. Position the floating panel anywhere on the content editor page for easy editing.

Salesforce Flow

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Compose intelligent workflows with Flow Builder and Flow Orchestration. Integrate across any system with Flow Integration.

Flow Builder

Modify record-triggered and scheduled-triggered flows with Agentforce. Navigate through Flow Builder with collapsible paths and new mouse controls. Sort and edit records in the Data Table screen component. Customize screen flows with component-level style overrides. Send messages to large audiences and use Wait elements in asynchronous broadcast flows. Use decisions, exit rules, reentry conditions, and more in activation-triggered flows. Send Marketing Cloud Engagement emails in segment-triggered, event-triggered, activation-triggered, and broadcast flows. Trigger automation event-triggered flows when records related to an individual are changed.

Flow Approval Processes

Complete approval step screen flows in Flow Builder while debugging flow approval processes without leaving Flow Builder. Start an autolaunched flow approval process from the new Request Approval component and let the submitter select the first approver.

Flow Orchestration

Create orchestrations and view orchestration dependencies with other automations in the Automation Lightning app. Complete orchestration work items in Flow Builder while debugging orchestrations without leaving Flow Builder.

Automation Lightning App Updates

Find which Agentforce agents and prompt templates reference standard and custom invocable actions by using the Action Hub tab in the Automation Lightning app. Gain visibility into flow performance with the new Flow Logs tab in the Automation Lightning app.

Simplify Integration with MuleSoft for Flow: Integration

MuleSoft for Flow: Integration is a no-code solution that connects your flows to external systems that use third-party connectors. Use these connectors as triggers or actions, creating seamless data and information exchange between systems.

Extract Data from Digital and Scanned Documents by Using MuleSoft for Flow: IDP (Generally Available)

Use MuleSoft for Flow: IDP to transform unstructured and semistructured data into structured, actionable output, enabling automation of document-based workflows. Organizations get lots of unstructured and semistructured documents that have important business data. But getting and processing this information by hand is time-consuming and can introduce mistakes. With MuleSoft for Flow: IDP you define what data to extract through custom configurations. You set confidence thresholds for automatic processing, and route low-confidence results for human review to verify accuracy. Manage your document processing configurations on the Document Processing tab in the Automation app.

Flow Builder

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Modify record-triggered and scheduled-triggered flows with Agentforce. Navigate through Flow Builder with collapsible paths and new mouse controls. Sort and edit records in the Data Table screen component. Customize screen flows with component-level style overrides. Send messages to large audiences and use Wait elements in asynchronous broadcast flows. Use decisions, exit rules, reentry conditions, and more in activation-triggered flows. Send Marketing Cloud Engagement emails in segment-triggered, event-triggered, activation-triggered, and broadcast flows. Trigger automation event-triggered flows when records related to an individual are changed.

Flow Builder Updates

Make changes to record-triggered and scheduled-triggered flows using natural language. Make navigating the Flow Builder canvas easier with collapsible branching paths and more intuitive mouse scrolling controls. Access the Agentforce panel without admin setup.

Screen Flow Updates

Sort and edit records in the Data Table component at runtime. Customize screen flows with component-level style overrides. Add colorful, a11y-compliant text to your screens with the new Message component. Streamline document-based screen flows with the File Preview component.

Visualize and track progress with the Kanban Board component (beta).

Flow Marketing Cloud Updates

Send Marketing Cloud Engagement emails in segment-triggered, event-triggered, activation-triggered, and broadcast flows. Trigger automation event-triggered flows when records related to an individual are changed. Get more control over schedule-triggered flows with more granular scheduling options. Use contact point selection rules to make sure your messages get to the right person. Send email messages using activation data.

Flow Data 360 Updates

Send messages to large audiences and use Wait elements with asynchronous broadcast flows. Use decisions, exit rules, reentry conditions, and more in activation-triggered flows. Access segment-triggered, automation event-triggered, and on-demand flows with a Data 360 license.

Flow Testing and Debugging

Save debug configurations when you save changes to a flow. Reuse tests from old flow versions.

Flow Runtime

Versioned updates are available for flows that are configured to run on API version 66.0.

Flow Management

Get insights into your flow's health with version-level analytics. Compare different versions of a screen flow. View flow dependencies in the Automation Lightning app. Visualize flow performance directly in Flow Builder.

Flow Extensions

Navigate to screen flows or autolaunched flows in Lightning Experience from custom Aura and Lightning web components.

Flow and Process Release Updates

Salesforce Flow has several release updates that are scheduled to be enforced in future releases.

Flow Builder Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Make changes to record-triggered and scheduled-triggered flows using natural language. Make navigating the Flow Builder canvas easier with collapsible branching paths and more intuitive mouse scrolling controls. Access the Agentforce panel without admin setup.

Get More Accurate Draft Flows with AI (Generally Available)

Agentforce breaks down your business requirements into specific tasks and gives generative AI-specific instructions on how to complete those tasks, making your record-triggered or schedule-triggered flows more accurate. Enter your instructions and let AI do the work. You can also use and modify the sample instructions and then generate the draft flow.

Evolve Flows Iteratively with Agentforce

Improve and modify existing record-triggered and schedule-triggered flows by using natural language without starting from scratch. Use conversational prompts in the Agentforce panel to add, modify, and delete elements in a flow. This feature doesn't consume generative AI credits.

Simplify Your Flow Builder Layout by Collapsing Branching Elements

Manage complex flows more efficiently by hiding unnecessary detail on the canvas. Now you can collapse and expand branching elements with Flow Builder, including Wait, Decision, Loop, Path Experiment, and Async Actions, helping you focus on the key parts of your flow. To ensure a consistent workflow, Flow Builder remembers your specific expand and collapse preferences. This layout is saved automatically and locally in your browser, making it easier to return to your work without changing the view for other users.

Set Up the Agentforce Panel Without Admin Configuration

Users can now quickly transition to the Agentforce panel and access new features such as creating, summarizing, or evolving a flow. This feature doesn't consume generative AI credits.

View Subflow Input and Output Variable Descriptions More Easily

The infobubbles for subflow output variables now show the custom description set by the admin or developer. If no custom description is defined, improved default text guides you to assign a resource. Additionally, view descriptions for a subflow's input resources in an infobubble even if the resource isn't included. Previously, you had to enable the input resource to know whether you needed it.

View Action Input Descriptions More Easily

Save time configuring flow actions. You can now hover over the infobubble next to an action input variable to view its description without including it. Upfront informational text helps you quickly understand why to use an input before deciding to assign it a value.

Navigate Flow Builder Faster with Mouse Scrolling

Navigating the Flow Builder canvas is now quicker and more intuitive. Previously, moving around the Flow Builder canvas required you to click and hold (grab and move) to pan across the elements.

Decision Logic Labels Were Updated for Clarity

The labels for the Decision Logic section of the Decision element were changed to Define Manually (Default) and Define with AI (Advanced). The new labels clarify that defining conditions manually is the first choice when working with structured data. When you can't define conditions because you're working with complex or unstructured data, use AI.

Get More Accurate Draft Flows with AI (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Agentforce breaks down your business requirements into specific tasks and gives generative AI-specific instructions on how to complete those tasks, making your record-triggered or schedule-triggered flows

more accurate. Enter your instructions and let AI do the work. You can also use and modify the sample instructions and then generate the draft flow.

Where: This change applies to Lightning Experience in Essentials, Pro Suite, Professional, Enterprise, Performance, Unlimited, and Developer editions with Foundations or Agentforce 1 editions. Verify Agentforce 1 editions feature availability with your account executive.

This feature doesn't consume generative AI credits. To learn more, see [Agentforce and Generative AI Usage and Billing](#).

How: Provision and enable [Data 360](#) in your org. Then, turn on [Einstein generative AI](#) in Setup.

Create a flow in Flow Builder, and in the Let AI Help You Build section, click **Get Started**. Enter your instructions and then click **Draft with AI**.

Evolve Flows Iteratively with Agentforce

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve and modify existing record-triggered and schedule-triggered flows by using natural language without starting from scratch. Use conversational prompts in the Agentforce panel to add, modify, and delete elements in a flow. This feature doesn't consume generative AI credits.

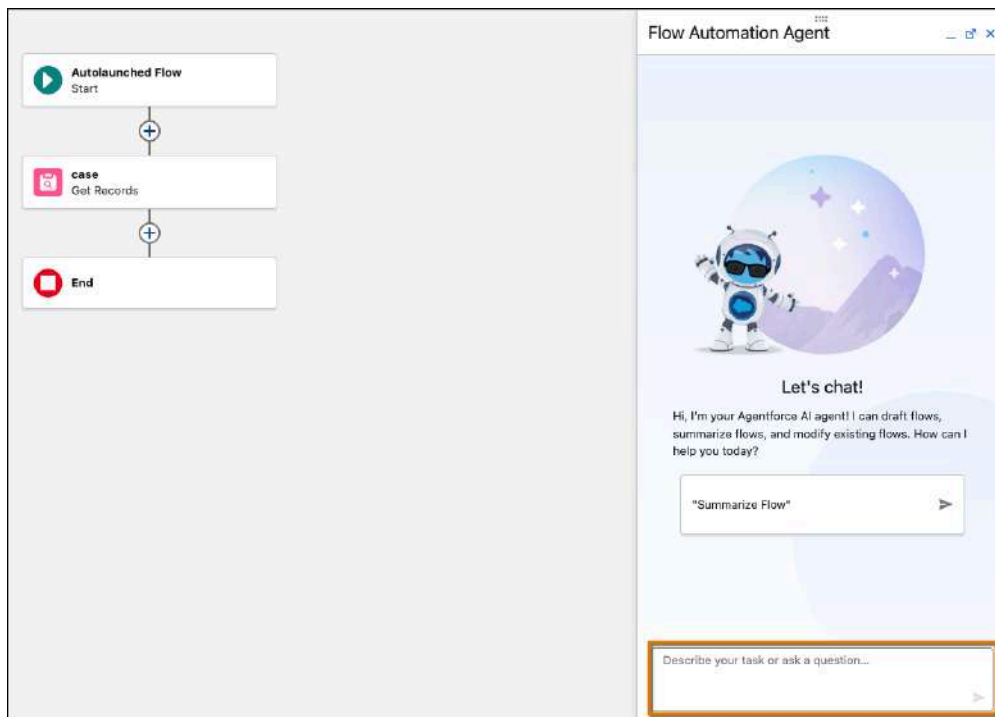

Where: This change applies to Lightning Experience in Essentials, Pro Suite, Professional, Enterprise, Performance, Unlimited, and Developer editions with Foundations or Agentforce 1 editions. Verify Agentforce 1 editions feature availability with your account executive.

Who: Users with the Manage Flow permission or equivalent flow designer permissions who can create and edit flows.

How: Provision and enable [Data 360](#) in your org. Turn on [Einstein generative AI](#) in Setup. Then, open any existing record-triggered or schedule-triggered flow in Flow Builder. Opt in to migrate to Agentforce, then use the Agentforce panel to describe the modifications you want to make. For example:

- "Add a decision element to check if the opportunity stage is Closed Won".
- "Remove the loop element that processes inactive accounts".
- "Add a fault path to handle errors in the Create Records element".

Agentforce processes your request and applies the changes to your flow, highlighting modifications on the canvas so you can quickly identify what changed.

Simplify Your Flow Builder Layout by Collapsing Branching Elements

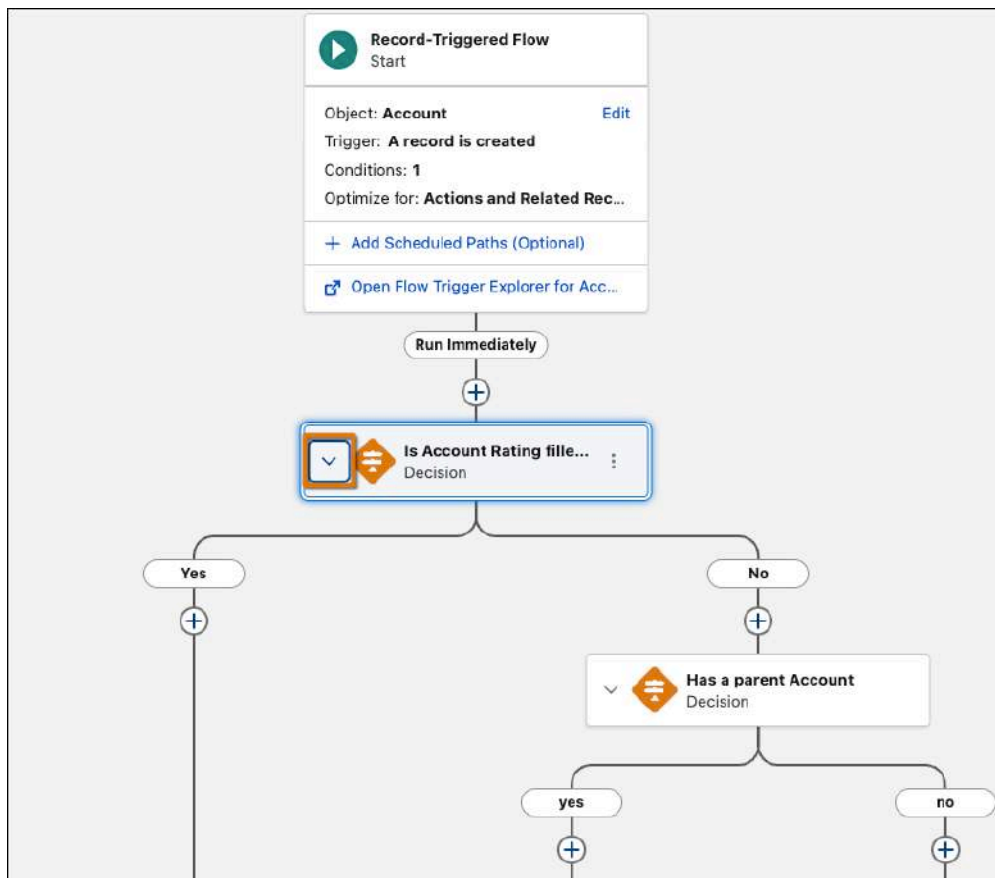

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Manage complex flows more efficiently by hiding unnecessary detail on the canvas. Now you can collapse and expand branching elements with Flow Builder, including Wait, Decision, Loop, Path Experiment, and Async Actions, helping you focus on the key parts of your flow. To ensure a consistent workflow, Flow Builder remembers your specific expand and collapse preferences. This layout is saved automatically and locally in your browser, making it easier to return to your work without changing the view for other users.

Where: This change applies to Lightning Experience, Salesforce Classic in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

How: Collapse and expand branching elements in the Flow builder canvas by clicking  or  next to an element's name.

Set Up the Agentforce Panel Without Admin Configuration

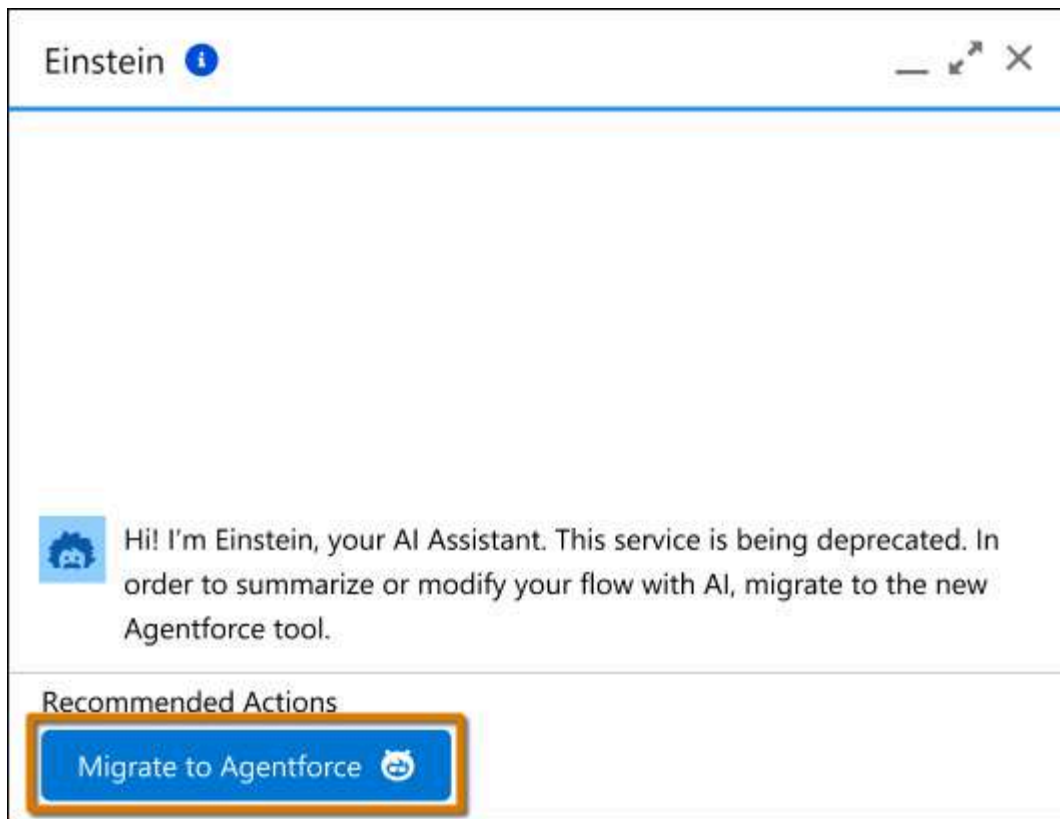

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Users can now quickly transition to the Agentforce panel and access new features such as creating, summarizing, or evolving a flow. This feature doesn't consume generative AI credits.

Where: This change applies to Lightning Experience in Essentials, Pro Suite, Professional, Enterprise, Performance, Unlimited, and Developer editions with Foundations or Agentforce 1 editions. Verify Agentforce 1 editions feature availability with your account executive. Agentforce must be enabled for the org and either the `AgentforceEmployeeAgent` or `AIEmployeeAgents` org permission must be enabled.

How: In the Einstein panel, click **Migrate to Agentforce** when modifying a flow. Or, when creating a new flow, select **Draft with AI** and Agentforce activates automatically if all requirements are met.

View Subflow Input and Output Variable Descriptions More Easily

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The infobubbles for subflow output variables now show the custom description set by the admin or developer. If no custom description is defined, improved default text guides you to assign a resource. Additionally, view descriptions for a subflow's input resources in an infobubble even if the resource isn't included. Previously, you had to enable the input resource to know whether you needed it.

Where: This change applies to Lightning Experience, Salesforce Classic in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

How: In Flow Builder, hover over the infobubble next to a subflow input resource to view its description without enabling it.

Referenced Flow

**Check Service Plan Eligibility for MessagingSession** ⓘ

▼

setup_service_plan__ChkEligMsgSess

Use values from the parent flow to set the inputs for the "Check Service Plan Eligibility for MessagingSession" flow. By default, the parent flow stores all outputs. You can either reference outputs via the API name of the Subflow element or manually assign variables in the parent flow to store individual outputs from the "Check Service Plan Eligibility for MessagingSession" flow.

Set Input Values

A₃ messagingSessionId ⓘ

☐ Not Included

View Output Resources

View the automatic output resources for the selected element. If you don't want to use this element's automatic output, you can manually assign variables to store the element's output.

A₃ ineligibilityReason ⓘ

meetsEligibility ⓘ

☒ Manually assign variables (advanced) ⓘ

Store Output Values

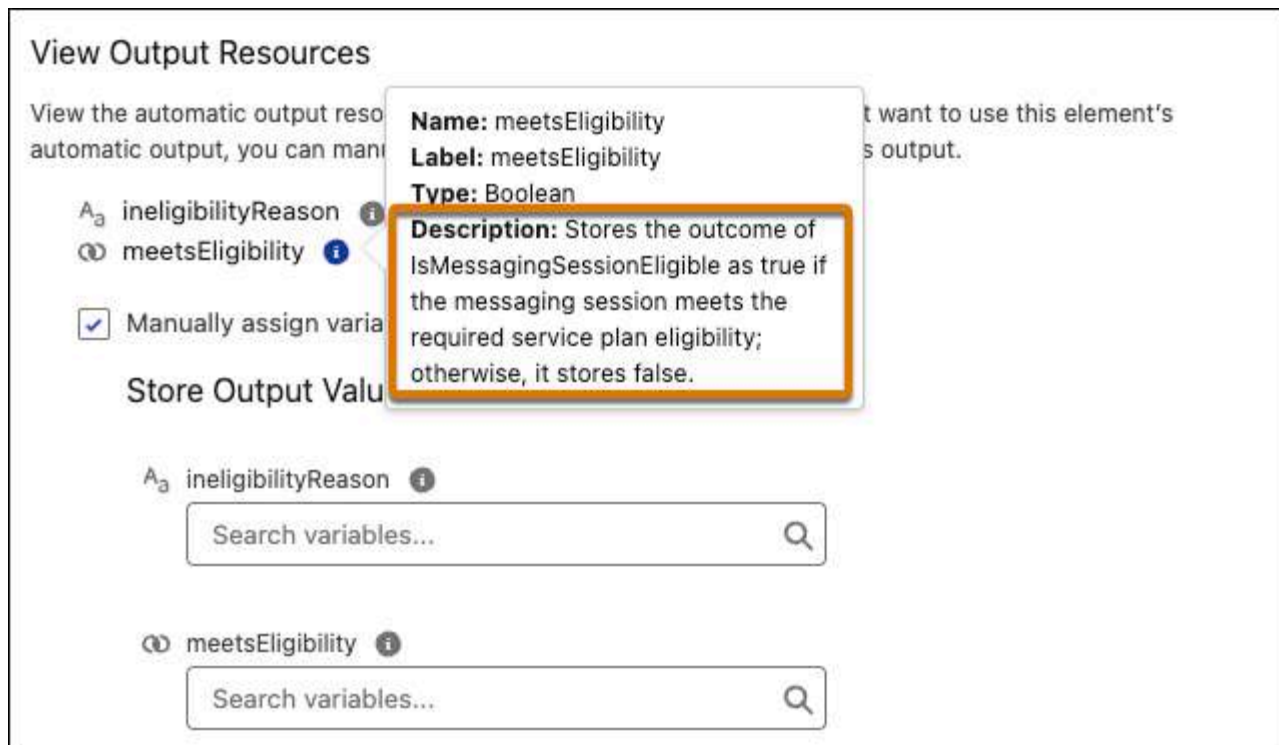

A₃ ineligibilityReason ⓘ

meetsEligibility ⓘ

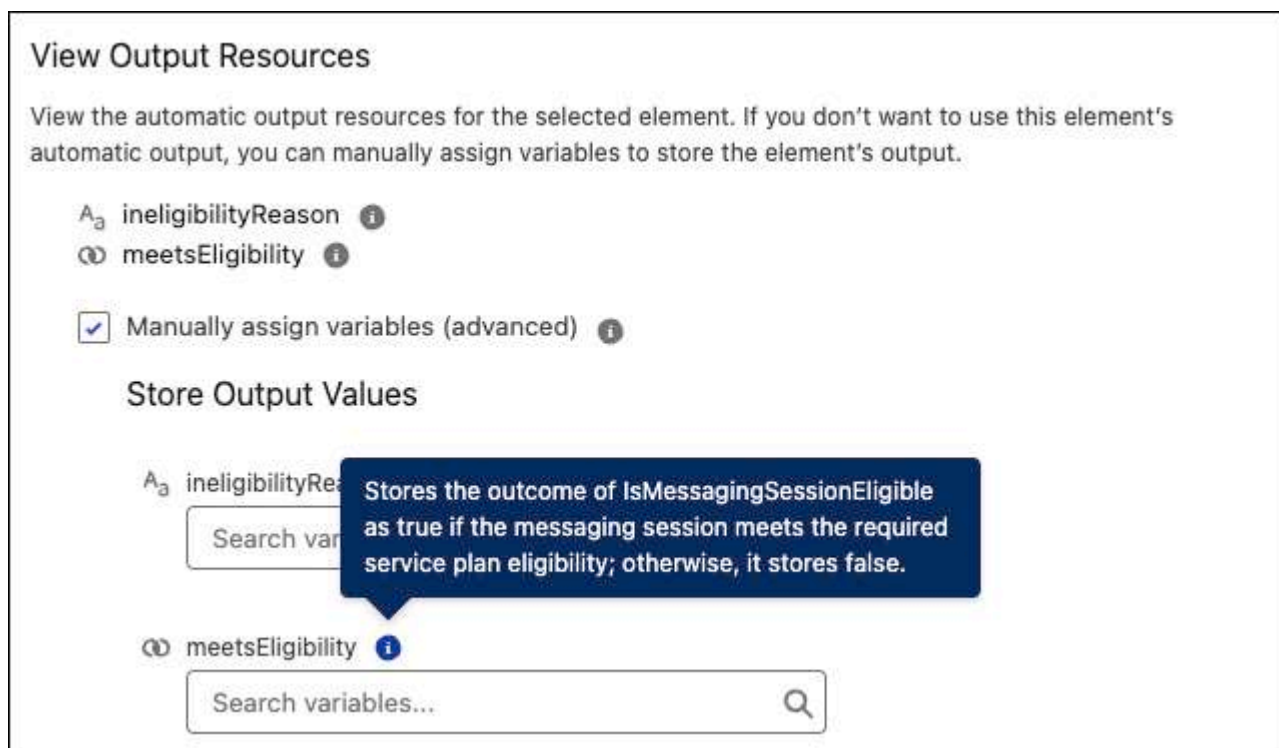

Stores the ID of the messaging session that was passed into the flow to check if it meets the eligibility criteria for a service plan.

For subflow outputs, hover over the infobubble in the View Output Resources list to see the variable's name, label, type, and description.

771

When you select Manually assign variables (advanced), the infobubble next to each output value shows the custom description, replacing the previous generic message.

View Action Input Descriptions More Easily

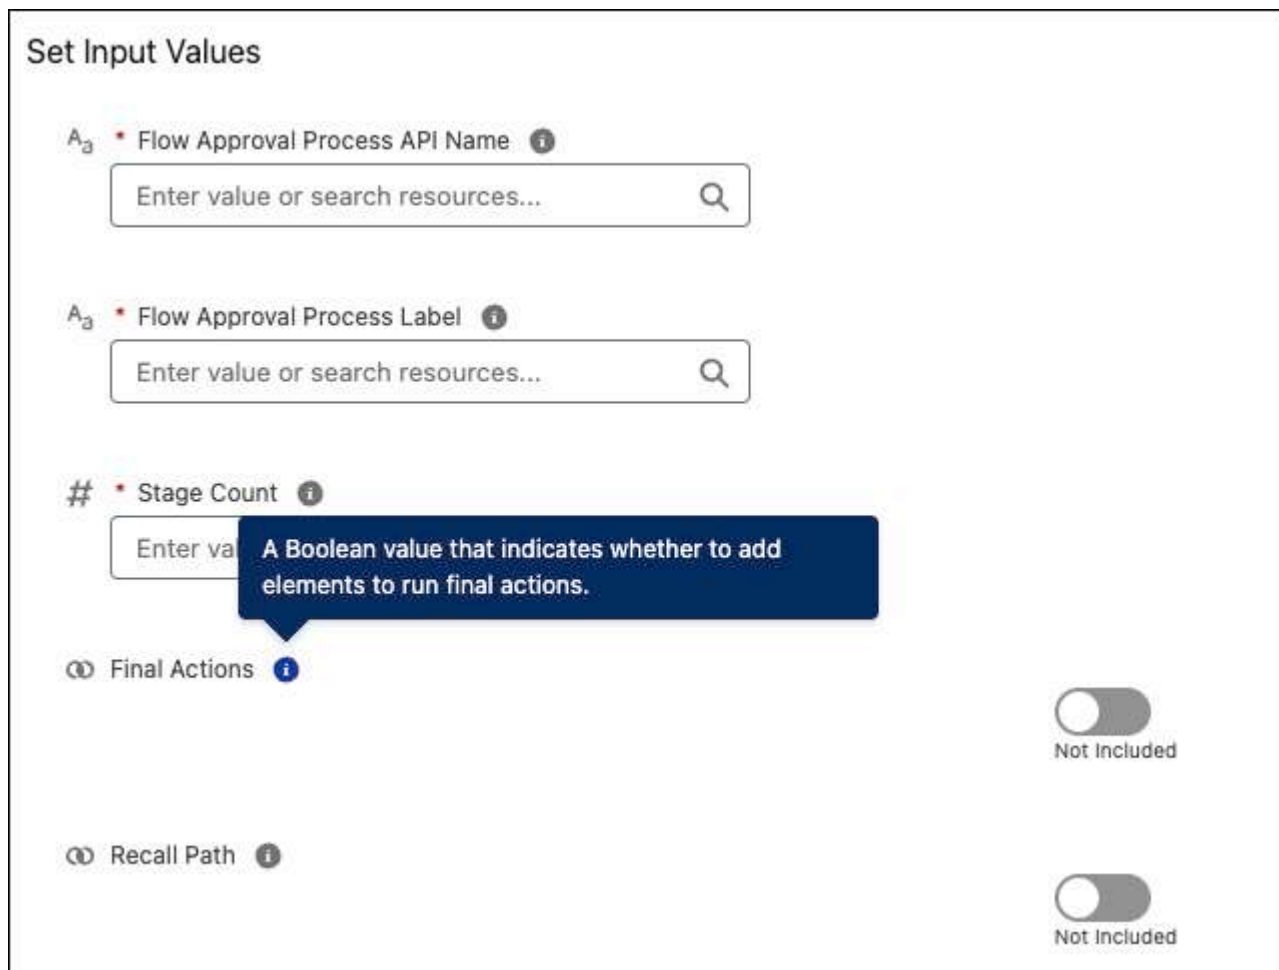

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Save time configuring flow actions. You can now hover over the infobubble next to an action input variable to view its description without including it. Upfront informational text helps you quickly understand why to use an input before deciding to assign it a value.

Where: This change applies to Lightning Experience, Salesforce Classic in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

How: In Flow Builder, add an action element. Locate an input parameter and hover over or click the infobubble next to it to view the description.

Navigate Flow Builder Faster with Mouse Scrolling

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Navigating the Flow Builder canvas is now quicker and more intuitive. Previously, moving around the Flow Builder canvas required you to click and hold (grab and move) to pan across the elements.

Where: This change applies to Lightning Experience, Salesforce Classic in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

How: Use your mouse scroll wheel, trackpad, or keyboard arrows keys to pan the canvas to view different areas of the flow.

Decision Logic Labels Were Updated for Clarity

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The labels for the Decision Logic section of the Decision element were changed to Define Manually (Default) and Define with AI (Advanced). The new labels clarify that defining conditions manually is the first choice when working with structured data. When you can't define conditions because you're working with complex or unstructured data, use AI.

Where: This change applies to Lightning Experience in Enterprise, Performance, and Unlimited editions with the Einstein for Sales, Einstein for Service, or Einstein Platform add-on. Einstein generative AI is available in Lightning Experience. To purchase the Einstein for Sales, Einstein for Service, or Einstein Platform add-on, contact your Salesforce account executive.

Screen Flow Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Sort and edit records in the Data Table component at runtime. Customize screen flows with component-level style overrides. Add colorful, a11y-compliant text to your screens with the new Message component. Streamline document-based screen flows with the File Preview component. Visualize and track progress with the Kanban Board component (beta).

Tailor Screen Flows to Your Audience with Component-Level Styling Overrides

Deliver a personalized screen flow experience to your customers. Customize a variety of style properties for your screen flows, like background color, border color, border weight, border radius, text color, buttons, and more. Any styling changes you set override your org or Experience Cloud site's default theme.

Add Visually Distinct and Accessible Messages to Screen Flows

With the new Message screen component, you can add an eye-catching a11y-compliant message to a screen to show information, a success, an error, or a warning.

Visualize and Track Record Progress with Kanban Boards in Screen Flows (Beta)

Use the new Kanban Board component to show records as cards in columns that represent workflow stages, without custom Lightning implementations. Your users gain instant visibility into record progress and record details without leaving the flow. The Kanban Board is read-only, so users can't drag cards between stages at run time.

Preview Files Natively in Screen Flows

Eliminate friction in document-based processes by enabling your users to review file content directly within a screen flow. The new File Preview screen component removes the requirement to download files externally, ensuring more streamlined document review and approval workflows.

Find and Select Flow Resources More Easily in Screen Flows

Flow Builder extends the enhanced resource selection experience to screen elements. For example, improved grouping makes it easier for you to find the resources that you need, user-friendly labels are shown instead of API names, tooltips with descriptions are available so you know more about what resource you're selecting, and the search experience allows for nested searches with breadcrumbs to keep track of where you are.

Open Screen Flows in Lightning Experience with a URL (Generally Available)

Launch screen flows in Lightning Experience and Lightning console apps with a new standardized URL format. Opening flows in Lightning has several benefits, such as faster performance, keeping your users in Lightning console apps, and providing a more consistent browser experience. You can also pass information into your flow through its URL. The new URL format also supports the Salesforce Cosmos theme, and flow local actions.

[Release Notes: Compare Screen Flow Versions to Track Changes More Efficiently](#)

Tailor Screen Flows to Your Audience with Component-Level Styling Overrides

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

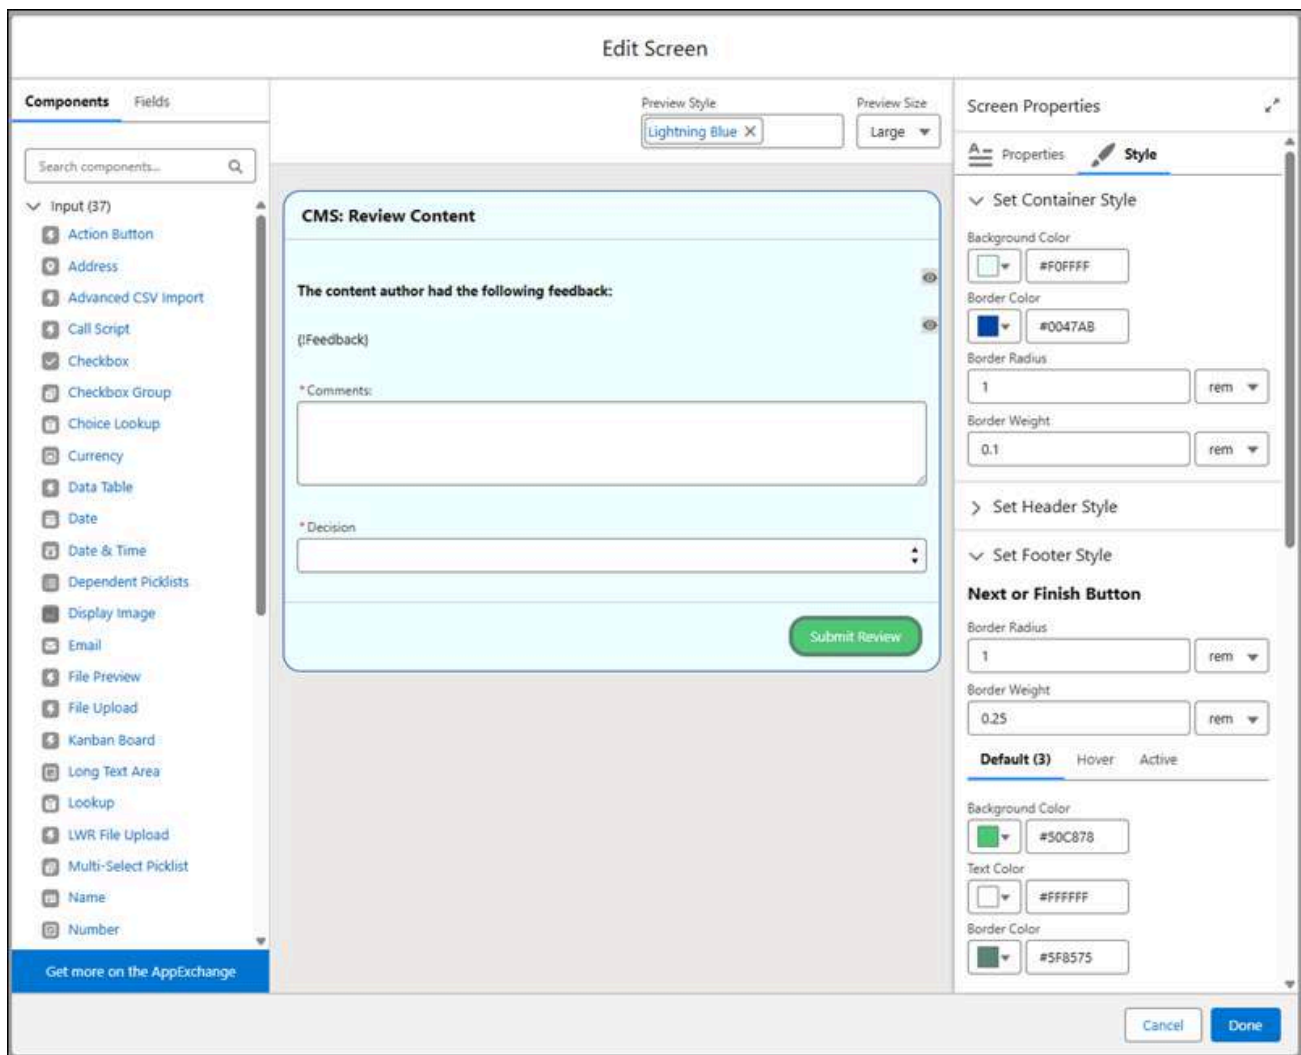

Deliver a personalized screen flow experience to your customers. Customize a variety of style properties for your screen flows, like background color, border color, border weight, border radius, text color, buttons, and more. Any styling changes you set override your org or Experience Cloud site's default theme.

Where: This change applies to Lightning Experience and Salesforce Classic in Essentials, Professional, Enterprise, Unlimited, and Developer editions.

This change also applies to [Aura](#), [LWR](#), and [Visualforce sites](#) accessed through Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions. You must have at least one active community license in your org to use this feature.

How: To customize the look for your screen, edit a screen. On the Screen Properties panel, select the **Style** tab. On the Style tab, you can set the styles for the header, container, and footer of your screen.

You can customize the styling for these components: Checkbox, Checkbox Group, Currency, Date, Date/Time, Display Text, Number, Long Text Area, Multi-Select Picklist, Password, Picklist, Radio Button, Repeater, Section, and Text.

[Salesforce Help: Flow Screen Output Component: Message Screen Component](#) (can be outdated or unavailable during release preview)

Visualize and Track Record Progress with Kanban Boards in Screen Flows (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the new Kanban Board component to show records as cards in columns that represent workflow stages, without custom Lightning implementations. Your users gain instant visibility into record progress and record details without leaving the flow. The Kanban Board is read-only, so users can't drag cards between stages at run time.

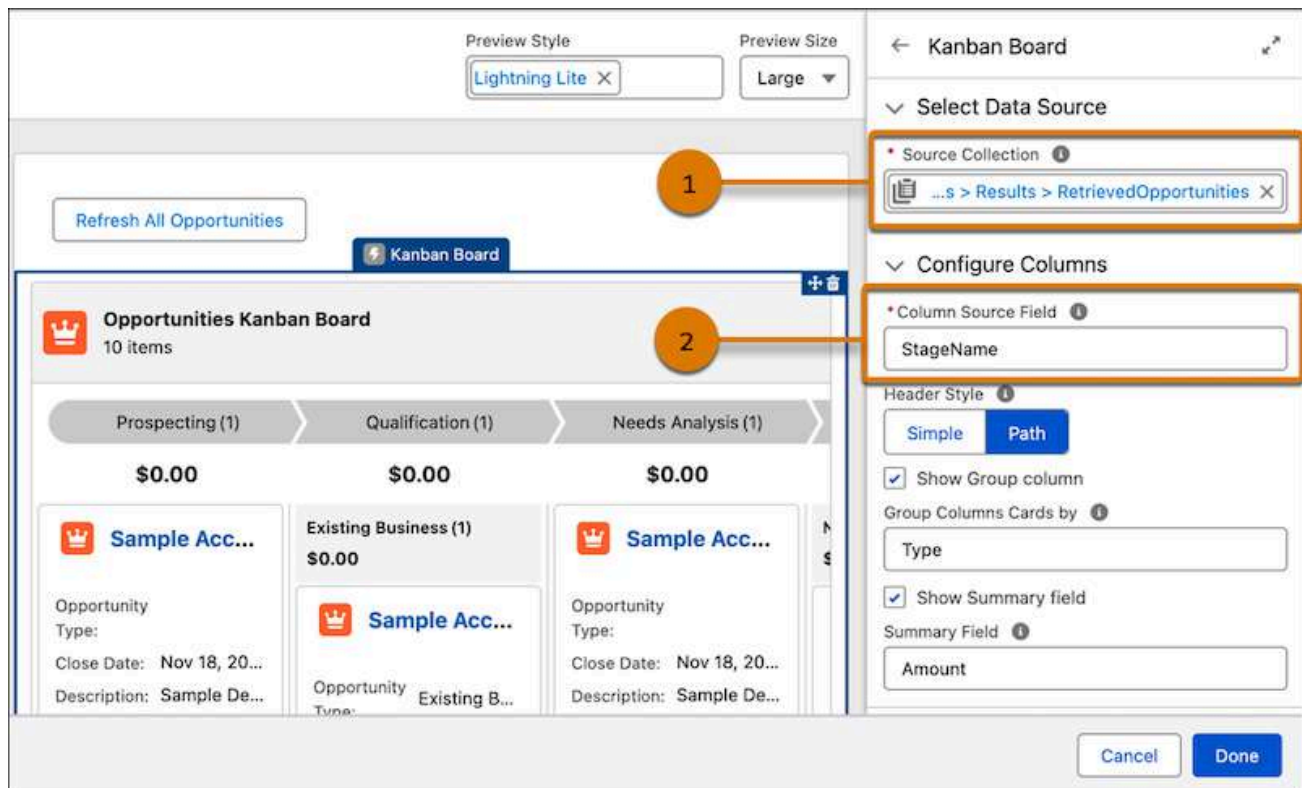

Where: This change applies to Lightning Experience and Salesforce Classic in Essentials, Pro Suite,

Professional, Enterprise, Performance, Unlimited, and Developer editions.

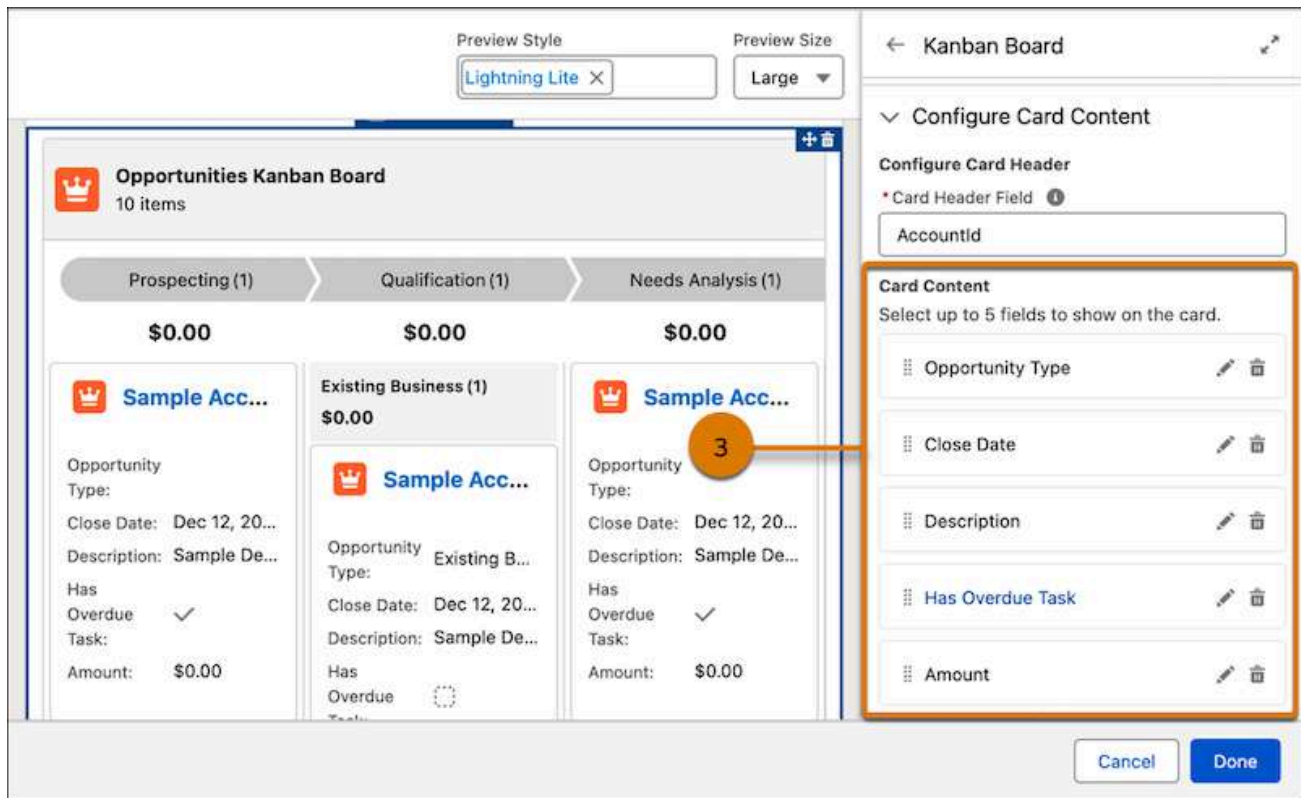

Note The Kanban Board screen component is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

How: Add the Kanban Board component to a screen and select a record collection whose records you want to show on the board. Then select a picklist field from Source Collection for column headers. You can select only picklist fields for column headers. The field order in the object metadata dictates the display order of columns. Finally, add the fields to show on record cards.

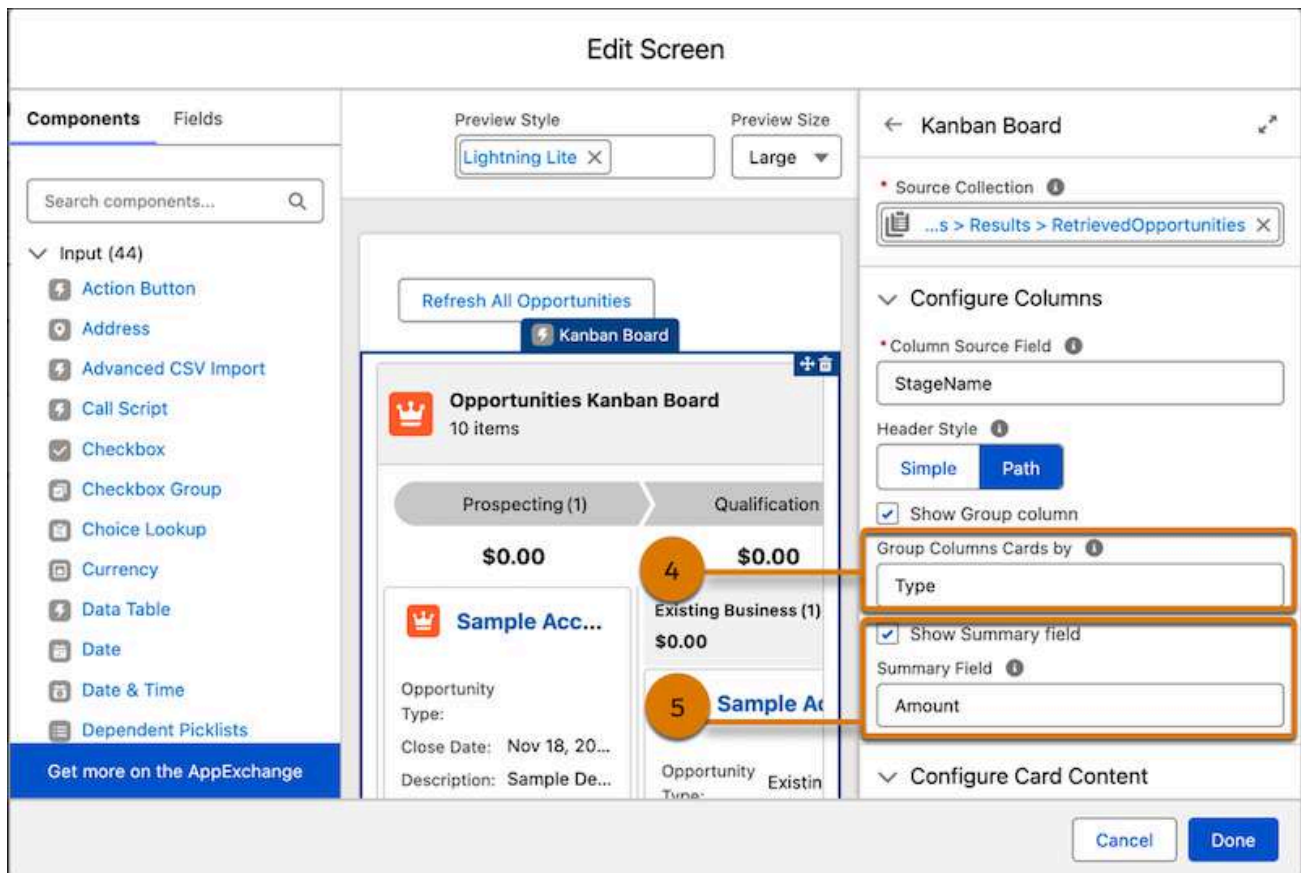

In this example, we used a Get Records element to fetch all Opportunity records, and set its output as the source collection (1). We selected the StageName picklist for the board's column headers (2).

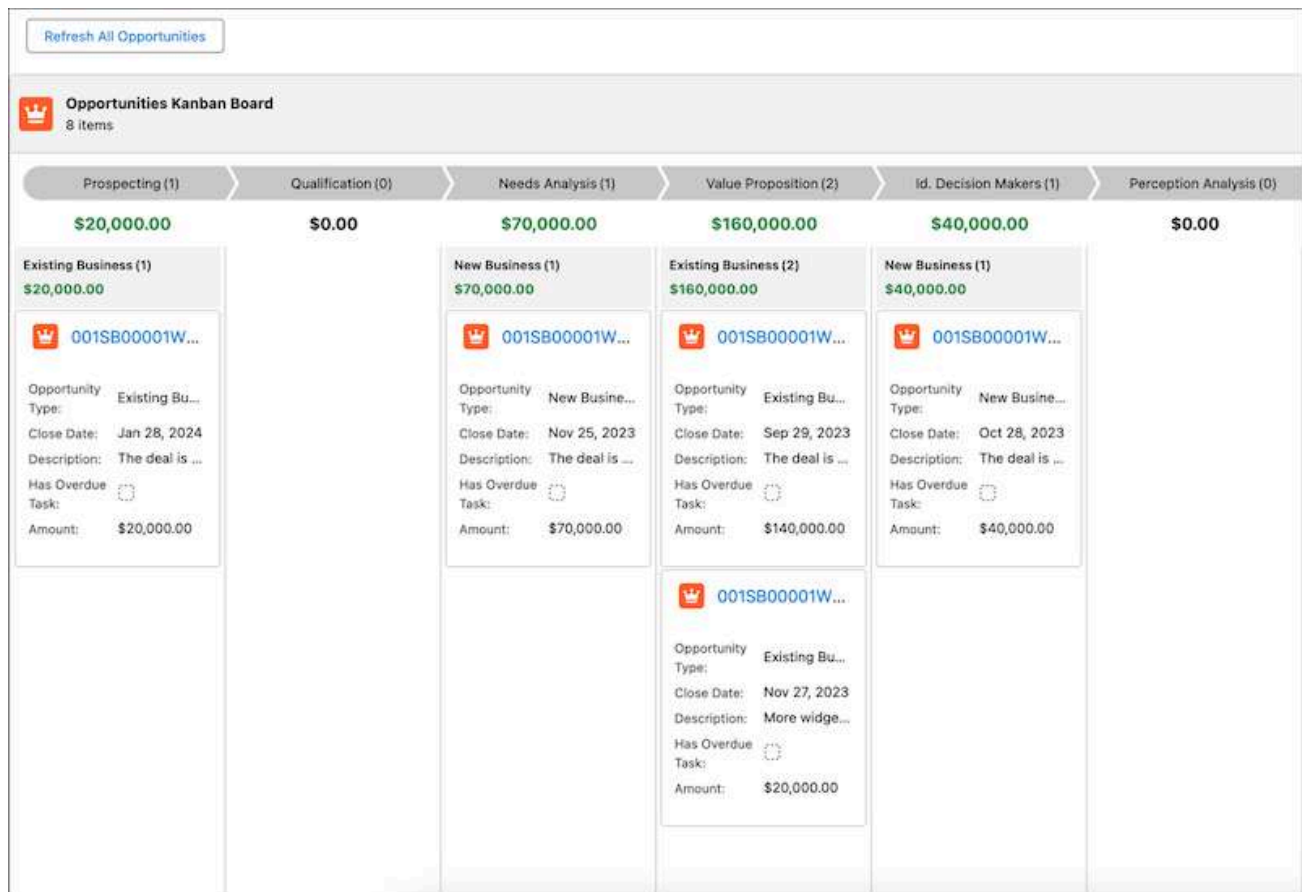

We added the Opportunity Type, Closed Date, Description, Has Overview Task, and Amount fields to the card content (3).

We then grouped the records by Opportunity Type (4) and selected the Summary Field (5) to show aggregates for the columns and groups.

Here's the run-time view of the Kanban Board.

Preview Files Natively in Screen Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Eliminate friction in document-based processes by enabling your users to review file content directly within a screen flow. The new File Preview screen component removes the requirement to download files externally, ensuring more streamlined document review and approval workflows.

Where: This change applies to Lightning Experience and Salesforce Classic in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

How: In Flow Builder, drag the File Preview component to your screen element. Configure the component by setting the Content Document ID to reference the document you want users to preview. Add a descriptive label to help users understand what they're reviewing. At runtime, users can view the document content within the screen flow and proceed with their tasks without interruption.

Find and Select Flow Resources More Easily in Screen Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Flow Builder extends the enhanced resource selection experience to screen elements. For example, improved grouping makes it easier for you to find the resources that you need, user-friendly labels are shown instead of API names, tooltips with descriptions are available so you know more about what resource you're selecting, and the search experience allows for nested searches with breadcrumbs to keep track of where you are.

Where: This change applies to Lightning Experience and Salesforce Classic in Essentials, Professional, Enterprise, Unlimited, and Developer editions.

Open Screen Flows in Lightning Experience with a URL (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Launch screen flows in Lightning Experience and Lightning console apps with a new standardized URL format. Opening flows in Lightning has several benefits, such as faster performance, keeping your users in Lightning console apps, and providing a more consistent browser experience. You can also pass information into your flow through its URL. The new URL format also supports the Salesforce Cosmos theme, and flow local actions.

Where: This change applies to Lightning Experience in Essentials, Professional, Enterprise, Unlimited, and Developer editions.

How: To open a flow in Lightning Experience, append `/lightning/flow/YourFlowNameHere` to your URL. To run a specific flow version, append `/lightning/flow/YourFlowNameHere/versionId` to your URL. Flows that open in Lightning Experience have improved performance because most required Lightning components are already loaded into the browser session. In Lightning console apps, your tabs are preserved when a flow opens, and you can switch to other tabs while the flow is working. Using the new URL format also ensures that your browser behaves consistently, with forward, back, and your browser history working as expected.

To pass data into a flow through its URL, append `?flow__variableIdHere=value` to the end of your URL. For example, to pass a case number into a flow, `/lightning/flow/YourFlowNameHere?flow__variableIdHereID={!Case.CaseNumber}`.

Use `&` to append multiple variables into a flow. For example, `/lightning/flow/YourFlowNameHere?flow__varUserFirst={!$User.FirstName}&flow__varUserLast={!$User.LastName}` passes both the user first name and last name into the flow.

Flow Marketing Cloud Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Send Marketing Cloud Engagement emails in segment-triggered, event-triggered, activation-triggered, and broadcast flows. Trigger automation event-triggered flows when records related to an individual are changed. Get more control over schedule-triggered flows with more granular scheduling options. Use contact point selection rules to make sure your messages get to the right person. Send email messages using activation data.

[Automate Marketing Cloud Engagement Emails from Flow Builder](#)

Send Marketing Cloud Engagement emails via segment-triggered, event-triggered, activation-triggered, or broadcast flows. The Send Marketing Cloud Engagement Email action efficiently targets Data 360 audience segments using your existing Marketing Cloud Engagement content and settings without requiring segment activation or data replication.

[Ensure Recipients Don't Get Duplicate Messages](#)

Use contact point selection rules to send messages to the right individual record and a single messaging contact point. This update improves message precision. The update also enables flows to retrieve contact points from source systems, so that a contact point can be selected even if identity resolution or the data graph has not been refreshed.

Send Email Messages Using Activation Data

In activation-triggered flows, to include data from the activation in the Send Email Message action, use the \$ActivationData variable in the email.

Run Segment-Triggered Flows at The Right Time with More Scheduling Options

Run segment-triggered flows on customizable schedules for more control and precision. For example, run a flow every hour to ensure you're working with the latest data, or schedule flows to run only on weekdays to avoid weekend sends. New scheduling options include Hourly, Daily on Weekdays, Weekly on specific days, Monthly on specific days, and Yearly.

Get More Targeted Segments in Segment-Triggered Flows

Create segment-triggered flows with segments built on Individual data model object (DMO) and engagement records, not just a Unified Individual DMO. For example, create a segment of all contacts converted yesterday. This update enables more precise targeting and provides access to engagement-specific data like order details or registration information.

Test Multiple Records in Segment-Triggered Flows in Debug

Test up to 10 records simultaneously. Use the debug panel to instantly verify how different customers move through your flow. This update helps you quickly identify issues across diverse customer profiles before activation.

Trigger Automation Event-Triggered Flows When CRM Records Change

Now you can trigger an automation event-triggered flow when a prospect, lead, or contact record changes, or when a record related to a prospect, lead, or contact record changes. For example, send a personalized email to a contact when a case is closed, or trigger a follow-up flow that notifies a lead owner when an opportunity moves to a new stage. This update helps you engage customers immediately when key business events occur, with prospect, lead, or contact data available for personalization in your messages.

Stay Informed About Path Experiment Outcomes

Users who activate flows now receive automatic in-app notifications when path experiments are completed. Notifications cover winner selection, fallback handling, and inconclusive outcomes. This change keeps flow creators informed without requiring additional setup. If the activating user is deactivated, no notification is sent.

View Path Comparison Analytics in Path Experiment Element

Monitor path experiment results without leaving the Flow Builder canvas. The new Analytics tab in the Path Experiment element panel shows total participants, metrics, and confidence levels for path comparison. Monitor experiment results at a glance with this embedded summary, which is consistent with analytics available in other flow elements. To see in-depth analytics, click View Analytics.

Control Path Selection When Debugging Path Experiments

Configure the Path Experiment element to randomize path assignment or manually select a winning path while debugging. Randomization is the default, but you can validate specific paths without relying on chance by using manual selection. With the manual selection configuration, you can test the exact path you want to validate.

[View Path Experiment History](#)

Understand what happened during your path experiments with the new History tab. View all changes since activation, including timestamps, who made changes, and whether actions were automated or manual. Track events like experiment start, winner selection, delayed group releases, and fallback handling.

[Trace Individual Paths Through Flows with View Flow Run for Individual](#)

Troubleshoot specific customer issues by viewing the exact execution path that an individual took through a flow run. This capability shows you which branching paths were followed, what elements were completed, and where the individual potentially encountered errors or delays. This detailed view helps administrators investigate specific customer complaints, verify personalization logic, and identify bottlenecks for specific contacts in your marketing automation flows.

[Personalize and Debug On-Demand Flows with Apex](#)

Personalize on-demand flows with Apex code and control processing priority when triggering flows via API. Select specific individuals and contact points to target messages. Debug flows with built-in debugging tools to test logic and identify issues before activation. Access help documentation from the start node to understand configuration options and best practices. These updates provide more flexibility for customizing flow behavior and faster troubleshooting during development.

[Remove Individuals from Flows Externally via API](#)

Remove individuals from flows when external systems trigger exits via API. For example, exit customers from flows when they complete an order or when they reach a specified status. This update provides more flexibility to coordinate flow exits with external systems.

Automate Marketing Cloud Engagement Emails from Flow Builder

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Send Marketing Cloud Engagement emails via segment-triggered, event-triggered, activation-triggered, or broadcast flows. The Send Marketing Cloud Engagement Email action efficiently targets Data 360 audience segments using your existing Marketing Cloud Engagement content and settings without requiring segment activation or data replication.

Where: These changes apply to Salesforce Enterprise and Unlimited editions with Marketing Cloud

Engagement and Marketing Cloud Next.

How: To use this action, add the Send Marketing Cloud Engagement Email element to the canvas. Select a business unit and then choose your email content. Choose a publication list for consent management. You can also map personalization data from your flow directly to a triggered send data extension.

Ensure Recipients Don't Get Duplicate Messages

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use contact point selection rules to send messages to the right individual record and a single messaging contact point. This update improves message precision. The update also enables flows to retrieve contact points from source systems, so that a contact point can be selected even if identity resolution or the data graph has not been refreshed.

Where: This change applies to Lightning Experience in Marketing Cloud Growth and Marketing Cloud Advanced editions, and requires Data 360.

How: For contact point selection rules, first configure rules with Data 360 activation templates. With your rules defined, open your flow and click **Select Segment** on the Start element to open the configuration panel. On the configuration panel, under Contact Point Configuration, select your activation template. Then, select the contact point you want to prioritize when selecting the individual record.

The screenshot displays the Salesforce Flow Builder interface. On the left, a flow diagram shows a 'Segment-Triggered Flow' start node connected to an 'End' node. On the right, the 'Select Segment' configuration panel is open, showing details for the 'All Unified Individuals' segment.

Select Segment Configuration:

- Segment:** All Unified Individuals
- Population:** 11
- Segment On:** Unified Individual
- Segment Status:** Active
- Publish Interval:** Don't refresh
- Next Publish Date Time:**
- Last Publish Completed:** 7/25/2025, 8:21 AM
- Segment Description:**

Decide When to Update This Segment

Segment membership is updated when the segment is republished. If you select On the segment's publish schedule and the publish schedule is set to Do not refresh, the segment's population isn't refreshed. If you select immediately before running the flow, the segment is republished immediately before the flow runs regardless of segment's publish schedule.

When do you want to republish this segment?

- ☒ On the segment's publish schedule
- ☐ Immediately before running this flow

Configure Contact Point Selection

To set up contact points, select an activation template. Activation templates determine a single contact point value for each segment member. For example, it selects only one email address if a segment member has multiple email addresses.

Activation Template: Second Test

Configure Individual Selection for Flow Profile

Specify how the system selects an individual record for your flow profile. When there are multiple individual records available, the channel priority order determines which record is selected.

Priority	Reorder	Contact Point Channel
1	↓ ↑	Email
2	↓ ↑	Phone

For engagement signals, when configuring your automation event triggered flow, specify where contact points come from. Contact points can come from the event data if they're included in the engagement data. Or contact points can come from source systems if they need to be retrieved. Flow automatically retrieves contact points using the method you select, ensuring messaging actions can execute successfully even for newly created individuals or when data is processing.

Send Email Messages Using Activation Data

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

In activation-triggered flows, to include data from the activation in the Send Email Message action, use the \$ActivationData variable in the email.

Where: This change applies to Lightning Experience in Marketing Cloud Growth and Marketing Cloud Advanced editions, and requires Data 360.

Run Segment-Triggered Flows at The Right Time with More Scheduling Options

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Run segment-triggered flows on customizable schedules for more control and precision. For example, run a flow every hour to ensure you're working with the latest data, or schedule flows to run only on weekdays to avoid weekend sends. New scheduling options include Hourly, Daily on Weekdays, Weekly on specific days, Monthly on specific days, and Yearly.

Where: This change applies to Lightning Experience in Foundations, Marketing Cloud Growth, and Marketing Cloud Advanced editions.

How: Go to the Start element configuration panel for a segment-triggered flow and select from the expanded scheduling options.

Set a Schedule

*** Select Schedule**

Run Once
Run the flow at a specified time and date or start it immediately.

Recurring (Selected)
Schedule and run the flow at set intervals.

To prevent duplicate messages, make sure that the segment you're using includes a filter that accepts only new contacts. [Learn More in Salesforce Help](#)

Set Recurring Schedule
Schedule when an audience can enter the flow. The schedule doesn't start until you activate the flow.

*** Start Date**
Dec 16, 2025

*** Start Time**
12:45 AM

*** Time Zone**
(GMT-08:00) Pacific Standard Time (America/Los_Angeles)

*** Repeat Schedule**

Hourly **Daily** Weekly Monthly Yearly

Run

☒ Every day
☐ Monday through Friday

Set Re-Entry Conditions
Select when a unified individual can rejoin a recurring scheduled flow. If you select After completion, the individual can only join the next scheduled occurrence after they exit the current one.

Can Rejoin Flow?

☒ Always
☐ After completion
☐ Never

Get More Targeted Segments in Segment-Triggered Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create segment-triggered flows with segments built on Individual data model object (DMO) and engagement records, not just a Unified Individual DMO. For example, create a segment of all contacts converted yesterday. This update enables more precise targeting and provides access to engagement-specific data like order details or registration information.

Where: This change applies to Lightning Experience in Marketing Cloud Growth and Marketing Cloud Advanced editions, and requires Data 360.

How: In a segment-triggered flow Start element, select a segment created on the Individual DMO or Engagement DMO from the segment selector.

The screenshot displays the Salesforce Flow Builder interface. On the left, a 'Segment-Triggered Flow Start' element is shown with fields for 'Segment Name: Individual Seg...', 'Population: 1', 'Last Publish Completed:', and 'Exit Rules: 0'. Below it is an 'End' element. On the right, the 'Select Segment' dialog is open, showing a search bar with 'Individual Segment' and a dropdown menu. Below the search bar, the 'Individual Segment' details are displayed, including 'Population: 1', 'Segment On: Individual', 'Segment Status: Active', 'Publish Interval: Don't refresh', 'Next Publish Date Time', and 'Last Publish Completed'. The dialog also includes a section titled 'Decide When to Update This Segment' with two radio button options: 'On the segment's publish schedule' (selected) and 'Immediately before running this flow'. Below this is a section titled 'Configure Contact Point Selection' with a dropdown menu for 'Activation Template'.

Test Multiple Records in Segment-Triggered Flows in Debug

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Test up to 10 records simultaneously. Use the debug panel to instantly verify how different customers move through your flow. This update helps you quickly identify issues across diverse customer profiles before activation.

Where: This change applies to Lightning Experience in Marketing Cloud Growth and Marketing Cloud Advanced editions. Use of segment-triggered flows requires Data 360.

How: When testing a segment-triggered flow, use checkboxes to select up to 10 records from the segment member list. Run the debugger and view the debug panel to cycle through each result, filter by errors or successes, and monitor the path highlighted on the flow canvas for the currently selected record.

Trigger Automation Event-Triggered Flows When CRM Records Change

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Now you can trigger an automation event-triggered flow when a prospect, lead, or contact record changes, or when a record related to a prospect, lead, or contact record changes. For example, send a personalized email to a contact when a case is closed, or trigger a follow-up flow that notifies a lead

owner when an opportunity moves to a new stage. This update helps you engage customers immediately when key business events occur, with prospect, lead, or contact data available for personalization in your messages.

Where: This change applies to Lightning Experience in Starter, Foundations, Marketing Cloud Growth, Marketing Cloud Advanced, and Data 360 editions.

How: Create an automation event-triggered flow and select “Prospect, Lead, Contact or Related Record Change” as the trigger type. Select the triggering Prospect, Lead, or Contact object, or an object that has a relationship field with the Prospect, Lead, or Contact object. If the selected object isn’t Prospect, Lead, or Contact, select the related Prospect, Lead, or Contact object. Then configure when to trigger and set entry conditions. The triggering object becomes available as a variable in the Flow Resource Panel.

[Salesforce Help: View Individual Record Runs \(can be outdated or unavailable during release preview\)](#)

Personalize and Debug On-Demand Flows with Apex

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Personalize on-demand flows with Apex code and control processing priority when triggering flows via

API. Select specific individuals and contact points to target messages. Debug flows with built-in debugging tools to test logic and identify issues before activation. Access help documentation from the start node to understand configuration options and best practices. These updates provide more flexibility for customizing flow behavior and faster troubleshooting during development.

Where: This change applies to Lightning Experience in Marketing Cloud Growth and Marketing Cloud Advanced editions, and Data 360 editions. This feature requires Data 360.

Who: Available to users with Marketing Admin or Marketing Manager permission sets.

Remove Individuals from Flows Externally via API

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Remove individuals from flows when external systems trigger exits via API. For example, exit customers from flows when they complete an order or when they reach a specified status. This update provides more flexibility to coordinate flow exits with external systems.

Where: This change applies to Lightning Experience in Foundations, Marketing Cloud Growth, and Marketing Cloud Advanced editions.

How: Configure exit rules that can be triggered via API. Use the new REST API endpoint to exit individuals from flows programmatically. When API calls are received, individuals are immediately removed. API-driven exit rules work across segment-triggered flows, automation event-triggered flows, and on-demand flows.

Flow Data 360 Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Send messages to large audiences and use Wait elements with asynchronous broadcast flows. Use decisions, exit rules, reentry conditions, and more in activation-triggered flows. Access segment-triggered, automation event-triggered, and on-demand flows with a Data 360 license.

[Send Mass Notifications or Wait for Events with Asynchronous Broadcast Flows](#)

You can now set broadcast flows to run asynchronously. By running the flow asynchronously, you can send notifications to larger audiences or to add Wait elements to the flow. That means you can resume the flow after a certain event triggers, like if a customer opens an email.

[Use Decisions, Add Exit Rules, and More with Enhancements to Activation-Triggered Flows](#)

In activation-triggered flows, you can now use the Decision element, add exit and reentry conditions, pause an active flow, and in the Transform element, map activation data up to 5 levels deep.

[Use Flows with Data 360 Licenses and Increased Rate Limits](#)

Use segment-triggered, automation event-triggered, and on-demand flows in Data 360 with a Data 360 license. For example, create flows that trigger on segments or events or trigger flows via API from external systems. Create and use custom automation events in your flows. Data 360, Marketing Cloud Growth, and Marketing Cloud Advanced customers can now process up to 15 million actions per hour per org.

[Label for Custom Real-Time Data Graph Event Was Changed](#)

The label for the Custom Real-Time Data Graph Event automation event is now Real-Time Data Graph Record Change.

Send Mass Notifications or Wait for Events with Asynchronous Broadcast Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now set broadcast flows to run asynchronously. By running the flow asynchronously, you can send notifications to larger audiences or to add Wait elements to the flow. That means you can resume the flow after a certain event triggers, like if a customer opens an email.

Where: This change applies to Data 360 in Enterprise, Performance, Unlimited, and Developer editions. Broadcast flows are also available for Marketing Cloud Growth and Marketing Cloud Advanced editions with Data 360.

How: To run a broadcast flow asynchronously, in the Start element, select **Async** as the run type. With asynchronous broadcast flows you can add Wait elements to the flow. If an asynchronous broadcast flow is referenced in another flow through a subflow element, the asynchronous broadcast flow starts in a separate transaction while the parent flow continues.

See Also

[Salesforce Help: Create a Broadcast Flow \(can be outdated or unavailable during release preview\)](#)

Use Decisions, Add Exit Rules, and More with Enhancements to Activation-Trigged Flows

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

In activation-triggered flows, you can now use the Decision element, add exit and reentry conditions, pause an active flow, and in the Transform element, map activation data up to 5 levels deep.

Where: This change applies to Data 360 in Enterprise, Performance, Unlimited, and Developer editions. Activation-triggered flows are also available for Marketing Cloud Growth and Marketing Cloud Advanced editions with Data 360.

How: To add exit rules and set reentry conditions, edit the flow's Start element. You can reference the \$ActivationData system variable to set exit rules based on the activation. To set reentry conditions, select a value for the Can Rejoin Flow field. Always is the default value and means an individual can reenter a flow before they exit. After completion means individuals can enter a flow only after they exit it. Never means that an individual can't enter the flow again.

To pause an active flow, click the **Pause** button in the button bar. The button changes to a Resume button when paused. When a flow is paused, processing stops at each element and its people and data are held until you resume the flow. After you resume the flow, everything that was held is processed at one time and then the flow continues as usual.

See Also

[Salesforce Help: Create an Activation-Trigged Flow \(can be outdated or unavailable during release preview\)](#)

Use Flows with Data 360 Licenses and Increased Rate Limits

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use segment-triggered, automation event-triggered, and on-demand flows in Data 360 with a Data 360 license. For example, create flows that trigger on segments or events or trigger flows via API from external systems. Create and use custom automation events in your flows. Data 360, Marketing Cloud

Growth, and Marketing Cloud Advanced customers can now process up to 15 million actions per hour per org.

Where: This change applies to Lightning Experience in Data 360, Marketing Cloud Growth, and Marketing Cloud Advanced editions.

How: Create and activate segment-triggered, automation event-triggered, and on-demand flows just as you do with a Marketing Cloud license. Create custom automation events in your event library and use them in automation event-triggered flows. The increased rate limit is automatically applied to your org. Marketing Cloud-specific actions, such as messaging actions, still require a Marketing Cloud license.

[Salesforce Help: Flow Types](#)(can be outdated or unavailable during release preview)

Label for Custom Real-Time Data Graph Event Was Changed

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The label for the Custom Real-Time Data Graph Event automation event is now Real-Time Data Graph Record Change.

Where: This change applies to Data Cloud in Enterprise, Performance, and Unlimited Editions.

Why: Now, the label for the automation event is more understandable.

How: In an automation event-triggered flow, select **Real-Time Data Graph Record Change** instead of Custom Real-Time Data Graph Event.

Flow Testing and Debugging

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Save debug configurations when you save changes to a flow. Reuse tests from old flow versions.

[Retain Debug Configurations Within Flow Editing Sessions](#)

Preserve debug configurations when you save changes to your flow. Debug inputs such as triggering record values, debug options, and input variable values now remain set when you save flow changes within your Flow Builder session. Refreshing your browser or closing Flow Builder clears all debug settings.

[Assign Flow Tests to Specific Flow Versions for More Control](#)

Reuse tests from previous flow versions if the scenario still applies to a new version. Align flow tests precisely with each flow version so updates don't cause incorrect results from other flow versions.

Retain Debug Configurations Within Flow Editing Sessions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Preserve debug configurations when you save changes to your flow. Debug inputs such as triggering record values, debug options, and input variable values now remain set when you save flow changes within your Flow Builder session. Refreshing your browser or closing Flow Builder clears all debug settings.

Where: This change applies to Lightning Experience and Salesforce Classic in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

Assign Flow Tests to Specific Flow Versions for More Control

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

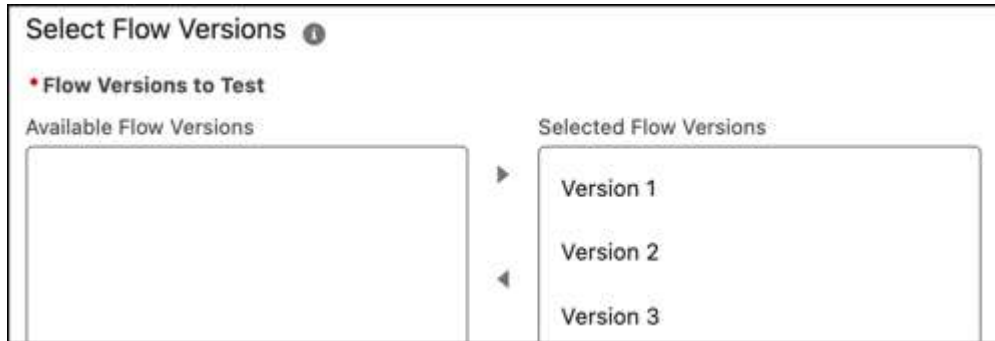

Reuse tests from previous flow versions if the scenario still applies to a new version. Align flow tests precisely with each flow version so updates don't cause incorrect results from other flow versions.

Where: This change applies to Lightning Experience in Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: Previously, a flow test applied only to the latest flow version. You deleted previous tests that didn't apply to the new flow version. For example, you deleted the flow test for flow version 1 after creating the flow test for flow version 2. Starting in Spring '26, you associate the same test with multiple flow versions. Decide which test scenario is for which flow version. When you save a new flow version, the system automatically includes tests from the source flow version.

How: From Flow Builder, open a record-triggered flow and create a flow test. Complete the test details. Then select the flow versions that you want to associate with the test.

The flow test runs for the selected flow versions.

Flow Runtime

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Versioned updates are available for flows that are configured to run on API version 66.0.

Flow and Process Run-Time Changes in API Version 66.0

These updates affect only flows and processes that are configured to run on API version 66.0 or later.

Flow and Process Run-Time Changes in API Version 66.0

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

These updates affect only flows and processes that are configured to run on API version 66.0 or later.

Where: This change applies to Lightning Experience, Salesforce Classic, and all versions of the mobile app in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

How: With versioned updates you can test and adopt run-time behavior changes for individual flows and processes at your convenience. To change the run-time API version of a flow, open it in Flow Builder and edit the flow version properties. To change the run-time API version of a process, open it in Process Builder and edit its properties.

Enforce No-Argument Constructor on Apex Classes

With this versioned update, you can access certain built-in Apex classes that are available to be used as invocable action parameters. This versioned update enforces no-argument constructor visibility of all Apex classes, including the `InvocableVariable` Apex class. Public no-argument constructors in managed packages are visible only when the access code is in the same package. An Apex action that refers to a non-visible no-argument constructor `InvocableVariable` Apex class results in errors.

Record-Triggered Flows Issue with Non-Insertable Fields Was Fixed

Record-triggered flows that run before records are saved now respect the internal writeable status of non-insertable fields. If existing flows try to update fields that aren't editable, this error message appears: Invalid target field for field update.

Flow Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get insights into your flow's health with version-level analytics. Compare different versions of a screen flow. View flow dependencies in the Automation Lightning app. Visualize flow performance directly in Flow Builder.

Monitor Flow Performance with View Flow Version Run Analytics

Get comprehensive insights into your flow version's overall health with new version-level analytics. Previously, understanding flow performance required piecing together data from individual element analytics or relying on incomplete aggregate metrics, which made it challenging to assess flow health holistically or spot systematic issues affecting multiple users. Now, you have a unified view showing completion rates, run status distributions, and detailed execution data across all individuals, so you

can better monitor performance, identify version-wide trends, and share comprehensive insights with stakeholders

Compare Screen Flow Versions to Track Changes More Efficiently

Use the Compare Versions feature to automatically track what's changed between any two versions of a screen flow. View changes to screen flow elements, resources, fields, properties, components, and styles between flow versions.

View Flow Usage in the Automation Lightning App

Understand flow dependencies with the new Usage subtab in the Automation Lightning app. The subtab shows bidirectional relationships, including which automations a flow version uses and which automation versions depend on that flow. This visibility helps you assess the impact of changes before modifying or deactivating flows.

Monitor Performance for Active and Previously Run Flows on the Canvas

Visualize flow performance directly in Flow Builder. Previously, on-canvas insights were available only for flows triggered by Data 360. Now you can view aggregated element run data for active and previously run flows directly on the canvas to identify performance bottlenecks without relying on logs or external reporting tools. Embedded analytics aren't available for screen flows or orchestrations.

Monitor Flow Performance with View Flow Version Run Analytics

This release is in preview

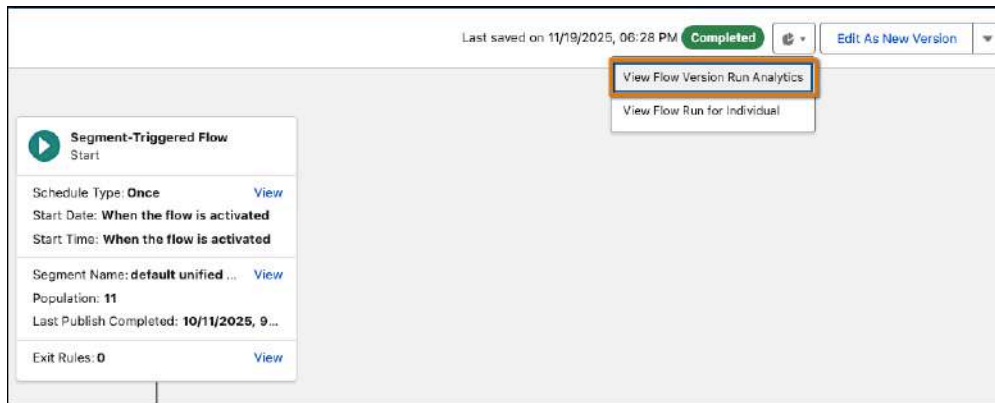

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get comprehensive insights into your flow version's overall health with new version-level analytics. Previously, understanding flow performance required piecing together data from individual element analytics or relying on incomplete aggregate metrics, which made it challenging to assess flow health holistically or spot systematic issues affecting multiple users. Now, you have a unified view showing completion rates, run status distributions, and detailed execution data across all individuals, so you can better monitor performance, identify version-wide trends, and share comprehensive insights with stakeholders

Where: This change applies to Lightning Experience in Marketing Cloud Growth and Marketing Cloud Advanced for automation event-triggered and segment-triggered flows with Data 360 element-level logging enabled.

Who: Users with Flow Performance installed and the Tableau Next Included App Business User permission set or higher-level permissions.

How: View version analytics in Flow Builder by opening a flow with completed runs, clicking , and selecting **View Flow Version Run Analytics** from the dropdown menu. Review the summary panel for overview metrics, or click **Open Details** to access the comprehensive Tableau dashboard.

Compare Screen Flow Versions to Track Changes More Efficiently

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the Compare Versions feature to automatically track what's changed between any two versions of a screen flow. View changes to screen flow elements, resources, fields, properties, components, and styles between flow versions.

Where: This change applies to Lightning Experience in Essentials, Pro Suite, Professional, Enterprise, Performance, Unlimited, Developer, and all Agentforce 1 editions.

How: From the Automation app for a screen flow, click the actions dropdown in the Flows list view, the flow's details page, or versions page, and click **Compare Versions**. Or, from Flow Builder, click the versions dropdown and then click **Compare Versions**. This option is available only if the screen flow has two or more versions.

Select the screen flow versions to compare, and then click **Compare Versions**. You can change either flow version to compare. The comparison results show changes made to elements, resources, and flow properties for the selected screen flow versions. You can select to either view only changes or show all the elements in the flow regardless of the change status. To show all items, deselect **Show Only Changed Items**.

Flow and Process Release Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce Flow has several release updates that are scheduled to be enforced in future releases.

[Enforcing No-Argument Constructor on Apex Classes Used for Invocable Action Parameters \(Release Update\)](#)

When this update is enabled, you get access to certain built-in Apex classes that are available to be used as invocable action parameters. Additionally, this update enforces the visibility of the no-argument constructor on any class. This update was scheduled to be enforced in Summer '26. Starting in Spring '26, Salesforce no longer enforces this update, but we recommend that you enable it. This

release update was previously named Enforce Permission Requirements Defined on Built-In Apex Classes Used as Inputs.

Sort Apex Batch Action Results by Request Order (Release Update)

With this update enabled, Apex batch action results are shown in the order that the requests are received. Currently, error-prone requests are prioritized at the top of the result list, and successful requests are at the bottom.

Enforcing No-Argument Constructor on Apex Classes Used for Invocable Action Parameters (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

When this update is enabled, you get access to certain built-in Apex classes that are available to be used as invocable action parameters. Additionally, this update enforces the visibility of the no-argument constructor on any class. This update was scheduled to be enforced in Summer '26. Starting in Spring '26, Salesforce no longer enforces this update, but we recommend that you enable it. This release update was previously named Enforce Permission Requirements Defined on Built-In Apex Classes Used as Inputs.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in Enterprise, Performance, Unlimited, and Developer editions.

When: This update was scheduled to be enforced in Summer '26. Starting Spring '26, Salesforce no longer enforces this update.

How: When you enable this update, built-in Apex classes that were unavailable become available for Apex actions. Because of this change, the visibility of the no-argument constructor for the `InvocableVariable` Apex class is also enforced. Public no-argument constructors in managed packages are no longer visible unless the access code is in the same package. An Apex action that refers to a non-visible no-argument constructor `InvocableVariable` Apex class results in errors.

From Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. To get the Enforcing No-Argument Constructor on Apex Classes Used for Invocable Action Parameters release update, follow the testing and activation steps.

Sort Apex Batch Action Results by Request Order (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With this update enabled, Apex batch action results are shown in the order that the requests are received. Currently, error-prone requests are prioritized at the top of the result list, and successful requests are at the bottom.

Where: This change applies to Lightning Experience and Salesforce Classic in Enterprise, Performance, Unlimited, and Developer editions.

When: Salesforce enforces this update in Summer '26. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the maintenance tab.

Why: Currently, error-prone requests are prioritized at the top of the result list, and successful requests are at the bottom. With this change, action results are shown in the order that the requests are received.

How: After this update is applied, Apex batch action results are shown in the order that the requests are received. Then, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. To get the Sort Apex Batch Action Results by Request Order release update, follow the testing and activation steps.

Flow Approval Processes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Complete approval step screen flows in Flow Builder while debugging flow approval processes without leaving Flow Builder. Start an autolaunched flow approval process from the new Request Approval component and let the submitter select the first approver.

[Add Approval Submissions to Record Pages Without Custom Buttons](#)

Add a component for your users to submit records for approval without you creating a custom button. The Request Approval component works in both Lightning App Builder and Experience Builder. Configure built-in options for first approver selection and submission comments.

[Complete Approval Work Items in Flow Builder While Debugging](#)

While debugging a flow approval process, open an approval work item directly on the canvas from the approval step's card. After you complete the work item, the orchestration run resumes. Completing approval work items via email or by using the Review option from the Approval Work Items quick menu is unchanged.

View Flow Approval Process Automation Usage in the Approvals Lightning App

Quickly identify dependencies for your flow approval processes with the new Usage subtab. Select the Manage All Flow Approval Processes tile to open the All Flow Approval Processes list view. Select a flow approval process or version, then click Usage. The subtab shows automations that the selected item uses or automations that use the selected item.

Debug Specific Segments of Flow Approval Processes

Accelerate testing by debugging only a targeted stage or segment of your flow approval process.

Define a start point to skip earlier elements, an end point to stop at a specific stage, or both to target a segment. When you set a start point, use the Configure Test Input tab to set input values for steps that rely on outputs from skipped stages or steps. To debug a single stage, set it as both the start point and the end point.

Control Which Flow Approval Process Steps to Run in Debug Mode with Test Output

Use test output to debug flow approval process steps selectively in default mode. Skip steps that you don't want to run to focus on specific parts of your flow approval process. This capability, previously called Manually Set Output, was available only in rollback mode. The Configure Test Output tab replaces the Configure Debug tab.

Other Changes to Flow Approval Processes

Learn about improvements to Flow Approval Processes.

Add Approval Submissions to Record Pages Without Custom Buttons

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Add a component for your users to submit records for approval without you creating a custom button. The Request Approval component works in both Lightning App Builder and Experience Builder. Configure built-in options for first approver selection and submission comments.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, all Einstein 1, and Developer editions.

Who: To customize record page layouts in Lightning App Builder, you must have the Manage Flow user permission. To customize an Experience Cloud site, you need to be a member of the site and have the Create and Set Up Experiences user permission. Or you need to be a member of the site and an experience admin, publisher, or builder in that site.

How: Before you add the Request Approval component to a record page layout, consider what input you want from the submitter. If you plan to require that the submitter select a first approver, design a flow approval process to assign one or more approval steps to the `firstApprover` input variable. To expose optional submitter comments to approvers, use the `submissionComments` input variable in your flow

approval process.

After you add the Request Approval component to a page, configure it to reference the relevant active autolaunched flow approval process.

The component shows an Approval Request Comments field by default. To prevent the submitter from adding comments about a submission, select **Hide submitter comments**.

To require the submitter to select a first approver, select **Require submitter to select first approver**.

Complete Approval Work Items in Flow Builder While Debugging

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

While debugging a flow approval process, open an approval work item directly on the canvas from the approval step's card. After you complete the work item, the orchestration run resumes. Completing approval work items via email or by using the Review option from the Approval Work Items quick menu is unchanged.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: To debug a flow approval process, you must have the Manage Flow user permission.

How: Open a flow approval process and click **Debug** on the button bar. From the Debug pane's Setup tab, enter your input values, and if it isn't already, deselect **Run automation in rollback mode**. Then click **Run**.

On the Details tab of the Debug pane, click **Continue in Work Guide** on the approval step card. The work item opens in the Work Guide tab on the canvas in Flow Builder.

Other Changes to Flow Approval Processes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about improvements to Flow Approval Processes.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, all Einstein 1, and Developer editions.

Why: Flow approval process designers can now:

- Provide input values and setup options one time per Flow Builder session instead of for every flow approval process debug run. Flow Builder preserves debug data such as triggering record inputs, debug options, and input variable values when you switch between Edit mode and Debug mode. Refreshing your browser or closing Flow Builder clears all debug settings.
- Reduce email volume from approval work item notifications for individuals up the role hierarchy by using the new Send approval work item emails only to queue members setting. This approval setting limits notifications for queue-assigned approval steps to only queue members and their delegates. The setting has no effect if role hierarchy isn't enabled.
- Use the Step panel's Configure Test Output tab, previously known as Debug Configuration, to set test output values. The Manually Set Output Values option is now labeled Use Test Output. The new terminology reinforces that you're specifying test values to use instead of running actual steps. All functionality remains the same.
- Place the Orchestration Work Guide, renamed from Flow Orchestration Work Guide, on the record page of an approval step's related record in Experience Builder.
- Use the updated options in the Decision Logic section of the Decision element. See [Decision Logic Labels Were Updated for Clarity](#).

Flow Orchestration

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Create orchestrations and view orchestration dependencies with other automations in the Automation Lightning app. Complete orchestration work items in Flow Builder while debugging orchestrations without leaving Flow Builder.

Create Orchestrations from the Automation Lightning App

Start building orchestrations directly from the Automation Lightning app without going through Setup. Click New on the Orchestrations tab to open a filtered view of the New Automation window. Select the Autolaunched Automations or Triggered Automations category, and then select the specific orchestration type to create. Or search for the specific orchestration.

Complete Orchestration Work Items in Flow Builder While Debugging

Complete orchestration work items while debugging an orchestration without leaving Flow Builder. Open the orchestration work item directly on the canvas from an interactive step's card. After you complete the work item, the orchestration run resumes.

View Orchestration Automation Usage in the Automation Lightning App

Quickly identify dependencies for your orchestrations with the new Usage subtab. On the Orchestrations tab in the Automation Lightning app, select an orchestration or version, then click Usage. The subtab shows automations that the selected item uses or automations that use the selected item.

Debug Specific Segments of Flow Orchestrations

Accelerate testing by debugging only a targeted stage or segment of your orchestration. Define a start point to skip earlier elements, an end point to stop at a specific stage, or both to target a segment. When you set a start point, use the Configure Test Input tab to set input values for steps that rely on outputs from skipped stages or steps. To debug a single stage, set it as both the start point and the end point.

Control Which Orchestration Steps to Run in Debug Mode with Test Output

Use test output to selectively debug orchestration steps in default mode. Skip steps that you don't want to run to focus on specific parts of your orchestration. Previously called Manually Set Output, this capability was available only in rollback mode. The Configure Test Output tab replaces the Configure Debug tab.

Other Changes to Flow Orchestration

Learn about improvements to Flow Orchestration.

Create Orchestrations from the Automation Lightning App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Start building orchestrations directly from the Automation Lightning app without going through Setup. Click **New** on the Orchestrations tab to open a filtered view of the New Automation window. Select the Autolaunched Automations or Triggered Automations category, and then select the specific orchestration type to create. Or search for the specific orchestration.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Complete Orchestration Work Items in Flow Builder While Debugging

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Complete orchestration work items while debugging an orchestration without leaving Flow Builder. Open the orchestration work item directly on the canvas from an interactive step's card. After you complete the work item, the orchestration run resumes.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: To debug an orchestration, you must have the Manage Flow user permission.

How: Open an orchestration and click **Debug** on the button bar. From the Debug pane's Setup tab, enter your input values, and if it isn't already, deselect **Run automation in rollback mode**. Then click **Run**.

On the Details tab of the Debug pane, click **Continue in Work Guide** on the interactive step card. The work item opens in the Work Guide tab on the canvas in Flow Builder.

View Orchestration Automation Usage in the Automation Lightning App

This release is in preview

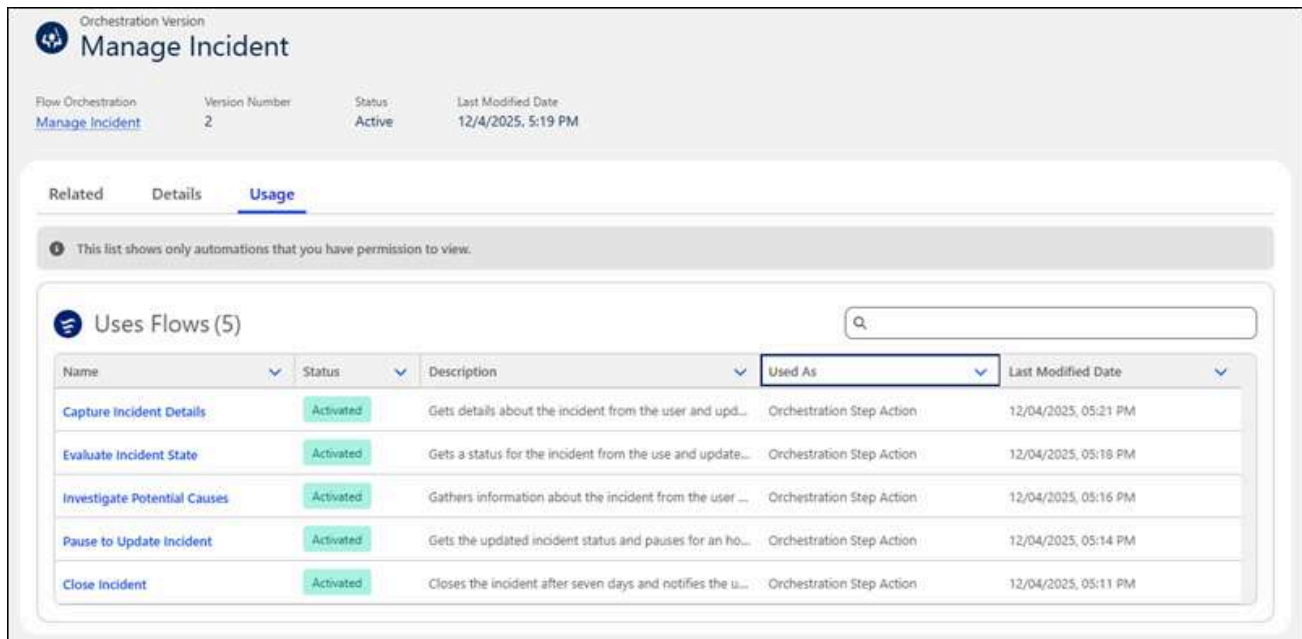

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly identify dependencies for your orchestrations with the new Usage subtab. On the Orchestrations tab in the Automation Lightning app, select an orchestration or version, then click Usage. The subtab shows automations that the selected item uses or automations that use the selected item.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: To view the flows that an orchestration version uses, you must have the Manage Flow user permission.

How: On the Usage subtab for a selected orchestration version, view the flows that the version uses and how it references them.

Debug Specific Segments of Flow Orchestrations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available

until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Accelerate testing by debugging only a targeted stage or segment of your orchestration. Define a start point to skip earlier elements, an end point to stop at a specific stage, or both to target a segment. When you set a start point, use the Configure Test Input tab to set input values for steps that rely on outputs from skipped stages or steps. To debug a single stage, set it as both the start point and the end point.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: To debug an orchestration, you must have the Manage Flow user permission.

Control Which Orchestration Steps to Run in Debug Mode with Test Output

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use test output to selectively debug orchestration steps in default mode. Skip steps that you don't want to run to focus on specific parts of your orchestration. Previously called Manually Set Output, this capability was available only in rollback mode. The Configure Test Output tab replaces the Configure Debug tab.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: To debug an orchestration, you must have the Manage Flow user permission.

Other Changes to Flow Orchestration

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about improvements to Flow Orchestration.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Why: Orchestration designers can now:

- Provide input values and setup options one time per Flow Builder session instead of for every orchestration debug run. Flow Builder preserves debug data such as triggering record inputs, debug options, and input variable values when you switch between Edit mode and Debug mode. Refreshing your browser or closing Flow Builder clears all debug settings.
- Reduce email volume from orchestration work item notifications for individuals up the role hierarchy. The new Send orchestration work item queue emails only to queue members setting in Process Automation Settings limits notifications for queue-assigned interactive steps to only queue members. The setting has no effect if role hierarchy isn't enabled.
- Use the Step panel's Configure Test Output tab, previously known as Debug Configuration, to set test output values. The Manually Set Output Values option is now labeled Use Test Output. The new terminology reinforces that you're specifying test values to use instead of running actual steps. All functionality remains the same.
- Place the Orchestration Work Guide, renamed from Flow Orchestration Work Guide, on the record page of an interactive step's related record in Experience Builder.
- Use the updated options in the Decision Logic section of the Decision element. See [Decision Logic Labels Were Updated for Clarity](#).

Automation Lightning App Updates

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Find which Agentforce agents and prompt templates reference standard and custom invocable actions by using the Action Hub tab in the Automation Lightning app. Gain visibility into flow performance with

the new Flow Logs tab in the Automation Lightning app.

See Where Actions Are Used in Agentforce Builder and Prompt Builder (Beta)

Find which Agentforce agents and prompt templates reference standard and custom invocable actions by using the Action Hub tab in the Automation Lightning app. Previously, the Action Hub tab only showed action usage across Flow Builder. Check the Usage tab to view specific agents and prompt templates that reference an action before you make changes.

Set Up and Monitor Flow Logging in One Place

Gain visibility into flow performance with the new Flow Logs tab in the Automation Lightning app. Data 360 stores flow run metrics and provides real-time flow performance insights. Use the Flow Logs tab to set up Data 360, configure flow logging, and track performance for enabled flows.

Simplify Integration with MuleSoft for Flow: Integration

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

MuleSoft for Flow: Integration is a no-code solution that connects your flows to external systems that use third-party connectors. Use these connectors as triggers or actions, creating seamless data and information exchange between systems.

Enhance Data Exchange with a Newly Added Third-Party Connector

Use the newly added Plaid third-party connector in flows for no-code connectivity. Use this third-party connector to facilitate data and information exchange between different systems.

Enhance Data Exchange with a Newly Added Third-Party Connector

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use the newly added Plaid third-party connector in flows for no-code connectivity. Use this third-party connector to facilitate data and information exchange between different systems.

Where: This change applies to Salesforce Classic and Lightning Experience in Professional (with API access add-on), Performance, Enterprise, and Unlimited editions.

Who: To create, view, edit, and delete connections, users need the Manage Integration Connections permission.

Why: The Plaid third-party connector is generally available and is a new addition to our previously existing set of third-party connectors.

Extract Data from Digital and Scanned Documents by Using MuleSoft for Flow: IDP (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use MuleSoft for Flow: IDP to transform unstructured and semistructured data into structured, actionable output, enabling automation of document-based workflows. Organizations get lots of unstructured and semistructured documents that have important business data. But getting and processing this information by hand is time-consuming and can introduce mistakes. With MuleSoft for Flow: IDP you define what data to extract through custom configurations. You set confidence thresholds for automatic processing, and route low-confidence results for human review to verify accuracy. Manage your document processing configurations on the Document Processing tab in the Automation app.

Where: This change applies to Lightning Experience and Salesforce Classic in Professional (with API access add-on), Performance, Enterprise, and Unlimited editions. Document processing configurations can be edited or deleted only in the Automation app. Requires the MuleSoft for Flow: IDP add-on license, which is available in multiple offerings.

How: Define the data fields and tables you want to extract from documents by creating a document processing configuration in the Automation Lightning app. Build the human review workflow by creating an orchestration that routes documents with low confidence scores to a screen flow for a user to manually review and continue the process. To process documents uploaded to Salesforce, in Flow Builder, add an Extract Data from Document action to a flow or an orchestration and select the Document ID and Document Processing Configuration to reference.

Salesforce for Slack Integrations

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Use Slack and Salesforce together to connect with customers, track progress, collaborate seamlessly, and deliver team success from anywhere.

Note For information about updates in previous releases, see [Salesforce for Slack Integrations Release Notes](#).

Security, Identity, and Privacy

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Redirections end for legacy host names, including instanced host names in API calls. Connected app creation is disabled by default for all Salesforce orgs. Salesforce Backup & Recover is now a native app. And, Privacy Requests fulfill your customers' Right to Be Forgotten requests.

Backup & Recover

Salesforce Backup & Recover is now a native app. Manage backups and recover data directly in your org with a refreshed user interface and automatic region detection.

Domains

Redirections end for legacy host names, including instanced host names in API calls. And if a third party serves your custom domain, update the target host name.

Identity and Access Management

Connected app creation is disabled by default for all Salesforce orgs. The Salesforce-managed app for the X (formerly Twitter) auth provider is being retired. Create a Canvas app with an external client app. Migrate SAML-enabled connected apps to external client apps.

Health Check

Health Check now provides deeper insight by tracking seven new configurable security settings, including MFA status, SAML enablement, and session management controls. Users can also configure who receives notifications whenever your Salesforce security health check score changes.

Privacy Center

Explore Privacy Requests as a new way to fulfill Right to Be Forgotten (RTBF) requests from your customers.

Salesforce Shield

Shield product enhancements make it easier for you to extend security policies to more of your data. Database Encryption is generally available in all regions. Data Detect now scans 100 objects and unlimited fields and Field Audit Trail storage limit increases from 60 to 200. Real-Time Event storage is turned on by default. The Shield app now has setup assistants and simpler access requirements.

Security Center

Optimize your security posture with centralized alerting across all tenants and enhanced visibility into Login Anomalies via dedicated dashboards. Gain deeper insights into permission assignments while streamlining response times through consolidated investigations and automated remediation plans.

Other Security Changes

Quickly see the impact of each violation in the Trusted URL and Browser Policy Violations list.

Backup & Recover

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce Backup & Recover is now a native app. Manage backups and recover data directly in your org with a refreshed user interface and automatic region detection.

Protect and Recover Your Data with the Backup & Recover App

Salesforce Backup & Recover is now a native Salesforce feature that helps you safeguard your Salesforce data by automatically generating daily backups of your data. Use these backups to identify and recover quickly from data loss or corruption. Rather than manage your backups externally, you can enable and manage them directly in your org.

Protect and Recover Your Data with the Backup & Recover App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Salesforce Backup & Recover is now a native Salesforce feature that helps you safeguard your Salesforce data by automatically generating daily backups of your data. Use these backups to identify and recover quickly from data loss or corruption. Rather than manage your backups externally, you can enable and manage them directly in your org.

Where: This change applies to Lightning Experience.

When: This feature is available on a rolling basis starting in Spring '26.

Who: Backup & Recover is available for customers in GovCloud and the Japan region.

How: To add the required licenses to your org, contact your Salesforce account executive.

Domains

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Redirections end for legacy host names, including instanced host names in API calls. And if a third party serves your custom domain, update the target host name.

Update References to Legacy Host Names (Release Update)

Prevent disruption for your customers and end users when the temporary redirection of legacy (non-enhanced) Salesforce host names ends. With this release update, those redirections end in all orgs. First available in Spring '25, this update is enforced in Spring '26.

Replace Instanced URLs in API Traffic

To prevent disruption after infrastructure updates that change your instance name, replace instanced URLs in API traffic with your org's My Domain login URL. Support for instanced URLs in API traffic ends in Summer '26.

Switch to a Stable Target Host Name for Your Custom Domain

If a third-party service or content delivery network (CDN) serves your custom domain, simplify your maintenance. Work with your third-party provider to change the target host name to your org's My Domain login URL.

A Warning Was Added for Potential Custom Domain Disruption

If your custom domain can experience disruption when you move to Salesforce Edge Network, you see a warning on the My Domain Setup page.

Regional Edge Routing Label Was Changed

To help you select a routing method for Salesforce Edge Network, the label for the regional method now includes your region name. The functionality and availability of this option are unchanged.

Update References to Legacy Host Names (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Prevent disruption for your customers and end users when the temporary redirection of legacy (non-enhanced) Salesforce host names ends. With this release update, those redirections end in all orgs. First available in Spring '25, this update is enforced in Spring '26.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in Group, Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

When: Salesforce enforces this release update in Spring '26. To get the major-release upgrade date for your instance, go to [Trust Status](#), search for your My Domain name or instance, and then click the maintenance tab.

Note The task that disables legacy redirections is completed gradually after the major release. Usually that task finishes within a few hours after you get the release, but it can take up to 24 hours. To control the timing of when those redirections stop in your org, disable legacy host name redirections from the My Domain page in Setup.

How: To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Update References to Legacy Host Names, follow the testing and activation steps.

Replace Instanced URLs in API Traffic

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To prevent disruption after infrastructure updates that change your instance name, replace instanced URLs in API traffic with your org's My Domain login URL. Support for instanced URLs in API traffic ends in Summer '26.

Where: This change applies to Lightning Experience and Salesforce Classic in all editions except Database.com.

See Also

[Update Instanced URLs in API Traffic \(Release Update\)](#)

Switch to a Stable Target Host Name for Your Custom Domain

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

If a third-party service or content delivery network (CDN) serves your custom domain, simplify your maintenance. Work with your third-party provider to change the target host name to your org's My Domain login URL.

Where: This change applies to Lightning Experience and Salesforce Classic in Enterprise, Performance, and Unlimited editions. This change applies only to custom domains with the domain configuration "Use a third-party service or CDN to serve the domain."

See Also

[Simplify Custom Domain Management with a Stable Target Host Name](#)

A Warning Was Added for Potential Custom Domain Disruption

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

If your custom domain can experience disruption when you move to Salesforce Edge Network, you see a warning on the My Domain Setup page.

Where: This change applies to Lightning Experience and Salesforce Classic in Enterprise, Performance, and Unlimited editions.

Why: A custom domain serves your site content on a domain that you own, such as `https://www.example.com`. When a third-party service or content delivery network (CDN) hosts a custom domain, the target host name for that domain changes when your org moves to Salesforce Edge Network. Until your third-party service or CDN updates that value, your custom domain stops working.

To reduce the risk of outages during the move to Salesforce Edge Network, we added a warning on the

My Domain page when you edit the Routing and Policies section. If your org isn't on Salesforce Edge Network and a third party serves at least one of the custom domains in the org, you see this warning.

Routing and Policies Save Cancel

Salesforce Edge Network Salesforce Edge Network applies to most provisioned and deployed domains for this org. See Salesforce Edge Network in Salesforce Help for details.

☐ Use Salesforce Edge Network i

A third-party serves one or more custom domains for this org. Before you move to Salesforce Edge Network, work with your third-party provider to update the target host name for those domains. [Learn more in help](#)

☒ Enable Salesforce Edge Network during the scheduled feature rollout. i

How: If you see this warning, coordinate with your third-party service or CDN to update the target host name for your custom domain as part of your move to Salesforce Edge Network.

Regional Edge Routing Label Was Changed

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To help you select a routing method for Salesforce Edge Network, the label for the regional method now includes your region name. The functionality and availability of this option are unchanged.

Where: This change applies to Lightning Experience and Salesforce Classic in Group, Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

Who: Regional routing for Salesforce Edge Network is available in orgs on a Hyperforce instance in Japan.

How: From Setup, in the Quick Find box, enter *My Domain*, and then select **My Domain**. In the Routing and Policies section, click **Edit**. If regional routing is available for your org, the label for that routing method includes your region name.

Routing and Policies Save Cancel

Salesforce Edge Network Salesforce Edge Network applies to most provisioned and deployed domains for this org. See Salesforce Edge Network in Salesforce Help for details.

This org uses Salesforce Edge Network. [i](#)

Routing Method

☐ Global [i](#)

☒ Use Salesforce locations in Japan only [i](#)

See Also

[Salesforce Help: Route My Domain Through Salesforce Edge Network \(can be outdated or unavailable during release preview\)](#)

Identity and Access Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Connected app creation is disabled by default for all Salesforce orgs. The Salesforce-managed app for the X (formerly Twitter) auth provider is being retired. Create a Canvas app with an external client app. Migrate SAML-enabled connected apps to external client apps.

Creation of New Connected Apps Is Disabled by Default

The ability to create new connected apps is disabled by default for all Salesforce orgs. This change improves security by removing the risks associated with connected apps. This update does not affect any existing connected apps, which will continue to function normally. Also, packaged, existing connected apps that are deployed in a new org aren't affected. We recommend using external client apps for all new integrations and migrating existing connected apps to external client apps.

Configure Canvas Plugin for External Client App

You can now create a Canvas app using the external client app framework, which is a more secure and modern replacement for connected apps. Existing connected apps with Canvas integrations continue to function normally, including those that are packaged and deployed. We recommend using external client apps for all new Canvas integrations.

Track Attempts to Use Uninstalled Connected Apps

You can now track denied attempts to use connected apps that aren't installed in your org (uninstalled apps for short). By tracking these denied attempts, you can identify both legitimate and suspicious attempts to use uninstalled apps. You can decide whether to allow usage of the app or to block it entirely.

New and Updated Security Alerts for OAuth Flows

To discourage users from connecting unfamiliar third-party apps to Salesforce, we added security

alerts for OAuth flows. These security alerts appear when a user connects a device to Salesforce via the OAuth 2.0 device flow. We also updated the security alert on the page where users authorize access to their data via OAuth 2.0 flows.

API-Only Users Are Blocked from Bridging into UI Sessions

To improve security, users with the API Only User permission can no longer bridge into UI sessions by using the frontdoor URL generated by the `/services/oauth2/singleaccess` endpoint, also known as UI Bridge API. This change can break integrations that unintentionally grant UI access to API-only users.

Set Up Passwordless Login with Passkeys (Beta)

Give users a fast, easy, and phishing-resistant alternative to passwords. You can now enable passwordless login with passkeys. With this feature, users can log in with a built-in authenticator (such as Touch ID or Face ID) or a security key (such as a YubiKey or mobile device). Look forward to fewer password resets, fewer login issues, and happier users.

Migrate SAML-Enabled Connected Apps to External Client Apps

Bring the improved usability and security of the external client apps framework to your SAML single sign-on (SSO) configurations. With a few clicks, you can now transform SAML-enabled connected apps into external client apps. After migration, you get an identical external app with all of your SAML configurations, while your old connected app remains in read-only mode.

Migrate to a Multiple-Configuration SAML Framework (Release Update)

If you see this release update, your Salesforce instance is using our original single-configuration SAML framework, which supports single sign-on (SSO) with only one identity provider. We're giving you a final reminder that with Summer '26, we're no longer supporting the single-configuration SAML framework. To make sure that your SSO configurations don't break, migrate to our newer multiple-configuration SAML framework, which supports SSO with multiple identity providers instead of just one. If you don't migrate, your SAML SSO configurations will stop working when this release update is enforced in Summer '26.

Salesforce-Managed X (Formerly Twitter) Authentication Provider Retirement (Release Update)

The Salesforce-managed app for the X (formerly Twitter) authentication provider is being retired. This update breaks any single sign-on (SSO) configurations that use the Salesforce-managed X app. To avoid disruptions, create a custom X app and update your SSO configurations.

New LinkedIn Authentication Providers Use LinkedIn API v2

To stay up to date with the latest LinkedIn API version, new LinkedIn authentication providers now use LinkedIn API v2. Configurations that you created before Spring '26 still use LinkedIn API v1. Also, new and existing authentication providers that use the Salesforce-managed LinkedIn app still use LinkedIn API v1.

Triple DES for SAML Single Sign-On Stops Working in Summer '26

In Summer '26, SAML single sign-on (SSO) configurations that use the Triple Data Encryption Standard (Triple DES) algorithm will stop working. This change applies to all SSO configurations that use the Triple DES algorithm, whether you use Salesforce as an identity provider or as a service provider. To improve security, use the Advanced Encryption Standard (AES) algorithms, AES 128 or AES 256, instead.

Sandbox Users with Non-Unique Usernames Can't Be Unfrozen

You can't unfreeze a sandbox user if their username exists in another sandbox instance. This change

prevents duplicate usernames for active, unfrozen users. To unfreeze a user with a non-unique username, update the username to a unique value.

Creation of New Connected Apps Is Disabled by Default

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The ability to create new connected apps is disabled by default for all Salesforce orgs. This change improves security by removing the risks associated with connected apps. This update does not affect any existing connected apps, which will continue to function normally. Also, packaged, existing connected apps that are deployed in a new org aren't affected. We recommend using external client apps for all new integrations and migrating existing connected apps to external client apps.

Where: This change applies to Lightning Experience, Salesforce Classic, and all versions of the mobile app in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: This change addresses an ongoing security threat that takes advantage of connected apps. This change encourages the adoption of external client apps, which are a more secure, modern replacement for connected apps.

How: With Spring '26, the ability to create connected apps is disabled. The Allow creation of connected apps preference in External Client App Settings is also removed. To enable creation of new connected apps, contact Salesforce Customer Support.

See Also

[Salesforce Help: External Client Apps \(can be outdated or unavailable during release preview\)](#)

Configure Canvas Plugin for External Client App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

You can now create a Canvas app using the external client app framework, which is a more secure and modern replacement for connected apps. Existing connected apps with Canvas integrations continue to function normally, including those that are packaged and deployed. We recommend using external client apps for all new Canvas integrations.

Where: This change applies to Lightning Experience in Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: With an external client app, you get full metadata compliance and second-generation packaging (2GP) support, with package installation and creation performance that's substantially faster than connected apps. Your Canvas app must now be installed in an org before they can be used.

How: You can create a Canvas app using the external client app framework in one of several ways from Setup.

- **Canvas App Previewer:** Create a “hello world” Canvas app on Heroku using the Java or Ruby template, while creating the corresponding external client app in Salesforce.
- **External Client App Manager:** Create an external client app with OAuth settings and configure its Canvas app settings.

Additionally, you can deploy or retrieve the Canvas external client app from an org using an SFDX project.

[Canvas Developer Guide: Quick Start \(can be outdated or unavailable during release preview\)](#)

Track Attempts to Use Uninstalled Connected Apps

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now track denied attempts to use connected apps that aren't installed in your org (uninstalled apps for short). By tracking these denied attempts, you can identify both legitimate and suspicious attempts to use uninstalled apps. You can decide whether to allow usage of the app or to block it entirely.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in all editions.

Why: To prevent unauthorized access to your data, Salesforce [automatically denies](#) attempts to use uninstalled connected apps unless a user has the Approve Uninstalled Connected Apps user permission. This user permission is intended only for highly trusted users, like admins. As a result, non-admin users can be blocked from using uninstalled apps that have legitimate use cases. Now that you can track denied attempts, you can easily see when a user is stuck in this situation. To allow these users to access legitimate apps from trusted developers, install these apps.

By tracking denied attempts, you can also see if a threat actor is trying to use connected apps to get access to your org. To tighten security, block suspicious apps. Blocking a connected app ends all sessions and prevents further usage, even for users with the Approve Uninstalled Connected Apps user permission.

How: On the Connected Apps OAuth Usage page in Setup, review the Denied Attempts Due to Usage Restriction column. You can also review the date and time of the most recent denied attempt.

Connected App	Description	Manage App Policies	User Count	Denied Attempts Due to Usage Restrictions	Last Denied Attempt Due to Usage Restriction	App Actions
CApp0			5	1	10/23/2020 10:23:54	Block Install
CApp1			2	1	10/22/2020 20:58:50	Block Install
CApp2			0	1	10/22/2020 22:28:33	Block Install

See Also

[Salesforce Help: Manage Current OAuth Connected App Sessions \(can be outdated or unavailable during release preview\)](#)

New and Updated Security Alerts for OAuth Flows

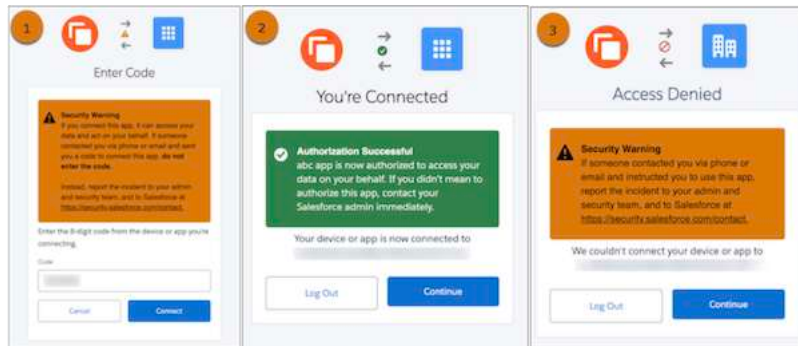

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To discourage users from connecting unfamiliar third-party apps to Salesforce, we added security alerts for OAuth flows. These security alerts appear when a user connects a device to Salesforce via the OAuth 2.0 device flow. We also updated the security alert on the page where users authorize access to their data via OAuth 2.0 flows.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in all editions.

How: During the device flow, users are prompted to enter a code from the device or app that they're connecting. We added a security alert to the page where users enter their code (1), to the page that indicates a successful connection (2), and to the page that indicates a denied connection (3).

We also updated the security alert on the page where users authorize an app to access their data via an OAuth flow.

If your external client app or connected app doesn't have a logo, Salesforce uses this default logo for the graphics above the warnings: . To brand these graphics, update the Logo Image URL in your app settings.

API-Only Users Are Blocked from Bridging into UI Sessions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and

where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To improve security, users with the API Only User permission can no longer bridge into UI sessions by using the frontdoor URL generated by the `/services/oauth2/singleaccess` endpoint, also known as UI Bridge API. This change can break integrations that unintentionally grant UI access to API-only users.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in all editions.

How: If you call the `/services/oauth2/singleaccess` endpoint with an access token that was issued to an API-only user, the call fails with this error.

```
{
  "error": "invalid_token",
  "error_description": "this token is invalid, unknown, or malformed"
}
```

To allow these users to bridge into UI sessions via frontdoor URLs, remove the API Only User permission.

See Also

[Salesforce Help: Generate a Frontdoor URL to Bridge into UI Sessions \(can be outdated or unavailable during release preview\)](#)

Set Up Passwordless Login with Passkeys (Beta)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give users a fast, easy, and phishing-resistant alternative to passwords. You can now enable passwordless login with passkeys. With this feature, users can log in with a built-in authenticator (such as Touch ID or Face ID) or a security key (such as a YubiKey or mobile device). Look forward to fewer password resets, fewer login issues, and happier users.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in all editions.

Note Passwordless login with passkeys is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer,

and applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Who: This feature is available only for internal users, such as employees, who log in to your Salesforce org. It isn't available for Experience Cloud site users.

Why: Passkeys are phishing-resistant, making them more secure than password-based authentication. They're also more convenient for users. Because passkeys inherently use multiple factors for authentication, they satisfy the Salesforce multi-factor authentication (MFA) requirement. So, if users log in with a passkey, they aren't prompted to provide a second factor for authentication, saving time and effort with each login.

Passkeys are based on the Fast Identity Online (FIDO) authentication standard. For more information on the benefits of passkeys, see the [FIDO documentation](#).

How: You can enable passwordless login with passkeys on the Identity Verification page in Setup. Passwordless login with passkeys is available only for users with a registered built-in authenticator or security key, and only for saved usernames. To log in, users click on their saved username and then use their built-in authenticator or security key.

Migrate SAML-Enabled Connected Apps to External Client Apps

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Bring the improved usability and security of the external client apps framework to your SAML single sign-on (SSO) configurations. With a few clicks, you can now transform SAML-enabled connected apps into external client apps. After migration, you get an identical external app with all of your SAML configurations, while your old connected app remains in read-only mode.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in all editions.

Why: External client apps are a more secure, modern replacement for connected apps. We recommend that you use external client apps instead of connected apps whenever possible. Previously, the external

client apps migration tool supported only the OAuth plugin. Now, you can migrate apps that use the SAML plugin.

How: In the App Manager, find your connected app and click **Migrate to External Client App**.

Migrate to a Multiple-Configuration SAML Framework (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

If you see this release update, your Salesforce instance is using our original single-configuration SAML framework, which supports single sign-on (SSO) with only one identity provider. We're giving you a final reminder that with Summer '26, we're no longer supporting the single-configuration SAML framework. To make sure that your SSO configurations don't break, migrate to our newer multiple-configuration SAML framework, which supports SSO with multiple identity providers instead of just one. If you don't migrate, your SAML SSO configurations will stop working when this release update is enforced in Summer '26.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in Enterprise, Unlimited, and Developer editions.

Note This release update is available only if you're using the single-configuration SAML framework. If you don't see this release update, you're already using the multiple-configuration framework, and this release update doesn't apply to your instance.

When: This update is enforced for production instances in Summer '26 and was enforced for sandboxes in Summer '24. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the maintenance tab.

This update was first made available in Spring '24. It was scheduled to be enforced for all instances in Summer '24, but we enforced it only for sandboxes in Summer '24. We postponed the enforcement date for production instances to Spring '26 and then postponed it again to Summer '26.

Why: We're removing support for the single-configuration SAML SSO framework that you currently use. With this change, all SAML SSO configurations must use our newer multiple-configuration framework. With the multiple-configuration SAML framework, you can integrate your org or Experience Cloud site with multiple external identity providers.

How: If you don't migrate to the multiple-configuration SAML framework, your SAML SSO configuration will break when this update is enforced.

When you follow the steps to migrate, your current SAML SSO configuration is preserved, but with some key changes:

- Your Salesforce login URL changes. Make sure you have a plan to communicate this change to your users.
- SAML responses from your identity provider must include the `audience` attribute. Work with your identity provider to update SAML responses as needed.
- Salesforce generates a new self-signed certificate and uses it to sign SAML requests.
- If Salesforce can't parse a SAML response, it isn't recorded in the login history.

Before you migrate your configuration in production, make sure you understand these changes, update your configuration accordingly, and test all changes in a sandbox.

To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Migrate to a Multiple-Configuration SAML Framework, follow the testing and activation steps.

Salesforce-Managed X (Formerly Twitter) Authentication Provider Retirement (Release Update)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The Salesforce-managed app for the X (formerly Twitter) authentication provider is being retired. This update breaks any single sign-on (SSO) configurations that use the Salesforce-managed X app. To avoid disruptions, create a custom X app and update your SSO configurations.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in Enterprise, Performance, Unlimited, and Developer editions.

When: Salesforce enforces this update in Summer '26. To get the major release upgrade date for your instance, go to [Trust Status](#), search for your instance, and click the maintenance tab.

Why: Some X authentication providers use an X app that Salesforce manages. With the Salesforce-managed X app, you can leave the consumer key and secret blank when you set up the authentication provider. In Spring '24, Salesforce removed the ability to use the Salesforce-managed X app for new authentication providers, but continued to support it for existing authentication providers that were created before Spring '24. Now, the Salesforce-managed X app is being fully retired. Instead, you must use a custom X app and specify its consumer key and secret in your authentication provider configuration. With a custom X app, you have more control over your SSO configuration.

Note This release update doesn't affect authentication providers that are associated with the [X Ads for Marketing Intelligence \(MI\) Connector](#).

How: If an X authentication provider uses the Salesforce-managed app, it stops working when this release update is enforced. Users can no longer use the authentication provider to log in via SSO.

To review this update, from Setup, in the Quick Find box, enter *Release Updates*, and then select **Release Updates**. For Salesforce-Managed X (Formerly Twitter) Authentication Provider Retirement, follow the testing and activation steps.

See Also

[Knowledge Article: Prepare for the Salesforce-Managed X \(Formerly Twitter\) Authentication Provider Retirement \(can be outdated or unavailable during release preview\)](#)

New LinkedIn Authentication Providers Use LinkedIn API v2

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To stay up to date with the latest LinkedIn API version, new LinkedIn authentication providers now use LinkedIn API v2. Configurations that you created before Spring '26 still use LinkedIn API v1. Also, new and existing authentication providers that use the Salesforce-managed LinkedIn app still use LinkedIn API v1.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in Enterprise, Performance, Unlimited, and Developer editions.

See Also

[Salesforce Help: Configure a LinkedIn Authentication Provider \(can be outdated or unavailable during release preview\)](#)

Triple DES for SAML Single Sign-On Stops Working in Summer '26

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

In Summer '26, SAML single sign-on (SSO) configurations that use the Triple Data Encryption Standard (Triple DES) algorithm will stop working. This change applies to all SSO configurations that use the Triple DES algorithm, whether you use Salesforce as an identity provider or as a service provider. To improve security, use the Advanced Encryption Standard (AES) algorithms, AES 128 or AES 256, instead.

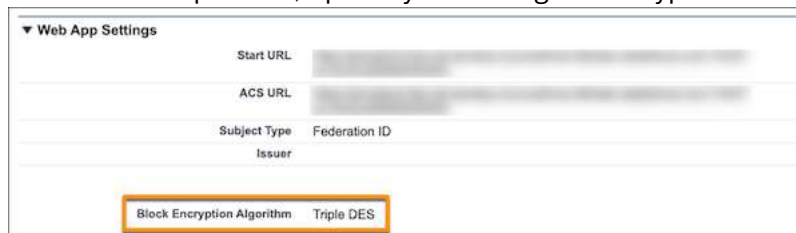

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all orgs) in all editions.

When: Triple DES will stop working in Summer '26. There's no change to Triple DES support in Spring '26, but we recommend that you update your SAML configurations as soon as possible.

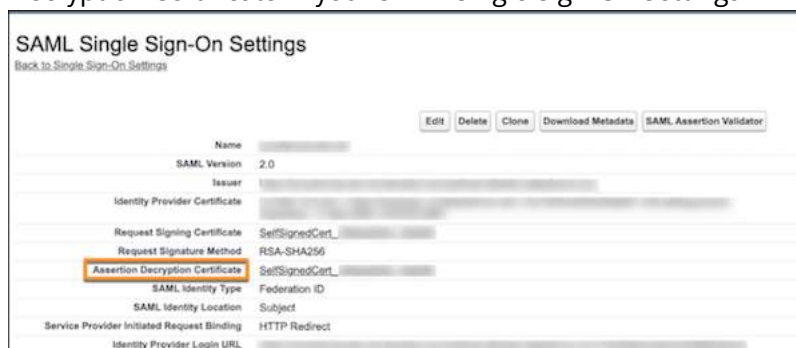

Why: The Triple DES algorithm uses a cryptographic key that's too short to be secure. The AES 128 and AES 256 algorithms use longer keys that make these algorithms harder to attack. For more information about encryption algorithm security from the National Institute of Standards and Technology, go to <https://csrc.nist.gov/pubs/sp/800/131/a/r3/ipd>.

How: Before Summer '26, update your configurations to use the AES 128 or AES 256 algorithm. The steps to update your configuration are different depending on whether you use Salesforce as an identity provider or as a service provider.

- If you use Salesforce as an identity provider, check your connected app SAML configuration. First, go to your connected app Web App Settings and check the Block Encryption Algorithm setting. If Block Encryption Algorithm is set to Triple DES, update your configuration to use a more secure algorithm. On the service provider, update your settings to decrypt the new algorithm.

- If you use Salesforce as a service provider, check with your identity provider to see what encryption algorithm they use. If they use the Triple DES algorithm, work with your identity provider to use a more secure algorithm and to generate a new decryption certificate. In Salesforce, update the Assertion Decryption Certificate in your SAML Single Sign-On Settings.

Salesforce Shield

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Shield product enhancements make it easier for you to extend security policies to more of your data. Database Encryption is generally available in all regions. Data Detect now scans 100 objects and unlimited fields and Field Audit Trail storage limit increases from 60 to 200. Real-Time Event storage is turned on by default. The Shield app now has setup assistants and simpler access requirements.

Get Shield Setup Assistants and Usage Insights

The Shield app now includes Setup Assistants for Data Detect, Field Audit Trail, Event Monitoring, and Platform Encryption. Maximize your Shield implementation by staying up to date on key setup tasks, ranging from user access to feature activation. Monitor and maintain your setup with at-a-glance insights, including usage metrics, data trends, and job statuses.

Simplify How Users Access the Shield App

If your users have the required permissions to access either Data Detect, Event Monitoring, or Platform Encryption, then they can view the Shield app by default. Previously, the View Shield App Pages user permission was required to view the app. Now, that permission is required only for users who lack other Shield-related access privileges.

Event Monitoring

Strengthen your security posture with automatic data storage by default for Report, ListView, Login, LoginAs, and Logout events, ensuring critical audit data is available from day one. Additionally, the Operation field in ApiEvent now tracks delete activities, providing deeper insight into critical data changes.

Data Detect

Data Detect scan scope and scale increase to handle 100 objects with unlimited fields. You can now scan for custom keywords alongside structured sensitive data to improve regulatory compliance and flag sensitive internal terminology. With the availability of a Standalone License for Data Detect, you can understand your Personally Identifiable Information (PII) exposure. Or, run a scan without needing to purchase the full Shield bundle.

Field Audit Trail

Field History Explorer enables users to download metadata and revert changes to tracked fields. The increased limit of 200 tracked fields per object further supports broader auditing needs and stricter compliance standards.

Shield Platform Encryption

Reduce friction in the encryption process with Database Encryption, now generally available in all regions. Bring Your Own Key for Data 360 opens more root key management options.

Get Shield Setup Assistants and Usage Insights

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Additionally, the Operation field in ApiEvent now tracks delete activities, providing deeper insight into critical data changes.

Automatic Storage for Select Real-Time Events

Data storage is now enabled by default for Report Event, ListView Event, Login Event, LoginAs Event and Logout Event. This ensures that critical security and audit event data is captured automatically from day one.

Delete Operation Tracking for ApiEvent

ApiEvent now tracks delete operations. The Operation field has been expanded to capture these critical activities for improved security monitoring.

Automatic Storage for Select Real-Time Events

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Data storage is now enabled by default for Report Event, ListView Event, Login Event, LoginAs Event and Logout Event. This ensures that critical security and audit event data is captured automatically from day one.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: This change is available to users with the Salesforce Shield or Field Audit Trail license.

Why: This change removes setup friction, guarantees event data is immediately available for investigations, and ensures your organization can meet crucial compliance and audit requirements without extra configuration.

Delete Operation Tracking for ApiEvent

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

ApiEvent now tracks delete operations. The Operation field has been expanded to capture these critical activities for improved security monitoring.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: This change is available to users with the Salesforce Shield or Field Audit Trail license.

Why: This change enables users to protect sensitive data integrity and prevent unauthorized changes.

Data Detect

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Data Detect scan scope and scale increase to handle 100 objects with unlimited fields. You can now scan for custom keywords alongside structured sensitive data to improve regulatory compliance and flag sensitive internal terminology. With the availability of a Standalone License for Data Detect, you can understand your Personally Identifiable Information (PII) exposure. Or, run a scan without needing to purchase the full Shield bundle.

[Increase Data Detect Scan Scope and Scale](#)

Now, you can create or edit a scan with 100 objects to include an unlimited number of fields and historical records. This means performing comprehensive data integrity and compliance scans across a broader dataset in a single operation.

[Scan for Custom Keywords with Data Detect](#)

Improve operational and regulatory compliance by identifying specific, sensitive exact words or phrases within your data. You can now optionally scan for custom keywords alongside structured sensitive data (custom patterns) when creating a Data Detect policy.

[Purchase a Standalone License for Data Detect](#)

You can now acquire Data Detect without purchasing the full Shield bundle. The system is configured

to validate the presence of this new, dedicated license and provide access to all Data Detect functionality.

Access and Run Data Detect Scans and Results with REST APIs

Use programmatic access with Salesforce Data Detect with two new REST APIs that can run and view scan results. Retrieve (GET) returns the list of existing Data Detect policies with their details. Scan posts the DataDetect policy scan for execution.

Increase Data Detect Scan Scope and Scale

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Now, you can create or edit a scan with 100 objects to include an unlimited number of fields and historical records. This means performing comprehensive data integrity and compliance scans across a broader dataset in a single operation.

Where: This change applies to Lightning Experience (not available in all orgs) in Enterprise, Unlimited, and Developer editions with the Salesforce Shield or Data Detect Licenses.

Scan for Custom Keywords with Data Detect

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve operational and regulatory compliance by identifying specific, sensitive exact words or phrases within your data. You can now optionally scan for custom keywords alongside structured sensitive data (custom patterns) when creating a Data Detect policy.

Where: This change applies to Lightning Experience (not available in all orgs) in Enterprise, Unlimited, and Developer editions with the Salesforce Shield or Data Detect Licenses.

Why: Custom keywords help you proactively mitigate risk by quickly flagging sensitive internal terminology like project code names or internally flagged risk terms.

Purchase a Standalone License for Data Detect

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

You can now acquire Data Detect without purchasing the full Shield bundle. The system is configured to validate the presence of this new, dedicated license and provide access to all Data Detect functionality.

Where: This change applies to Lightning Experience (not available in all orgs) in Enterprise, Unlimited, and Developer editions with the Salesforce Shield or Data Detect Licenses.

Why: If you need the flexibility for Data Detect to understand your Personally Identifiable Information (PII) exposure. Or, you want to run a scan before investing in full-scale remediation.

Access and Run Data Detect Scans and Results with REST APIs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Use programmatic access with Salesforce Data Detect with two new REST APIs that can run and view scan results. Retrieve (GET) returns the list of existing Data Detect policies with their details. Scan posts the DataDetect policy scan for execution.

Where: This change applies to Lightning Experience (not available in all orgs) in Enterprise, Unlimited, and Developer editions with the Salesforce Shield or Data Detect Licenses.

Why: Now, you can view Data Detect policies and run scans via APIs.

Field Audit Trail

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

Field History Explorer enables users to download metadata and revert changes to tracked fields. The increased limit of 200 tracked fields per object further supports broader auditing needs and stricter compliance standards.

Enhancements to Field History Tracking

Users can now download metadata and revert changes to tracked fields with the Field History Explorer feature of Field Audit Trail.

Increasing the Field Audit Trail Limit Beyond 60

Track more fields and meet compliance needs more efficiently with a significantly increased Field Audit Trail limit of 200 tracked fields.

Enhancements to Field History Tracking

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Users can now download metadata and revert changes to tracked fields with the Field History Explorer feature of Field Audit Trail.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: This change is available to users with the Salesforce Shield or Field Audit Trail license.

Why: This change adds much requested audit features to Field Audit Trail.

Increasing the Field Audit Trail Limit Beyond 60

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Track more fields and meet compliance needs more efficiently with a significantly increased Field Audit Trail limit of 200 tracked fields.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and

Developer editions.

Who: This change is available to users with the Salesforce Shield or Field Audit Trail license.

Why: This increase allows users to cover a broader scope of field history tracking on critical objects.

Shield Platform Encryption

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reduce friction in the encryption process with Database Encryption, now generally available in all regions. Bring Your Own Key for Data 360 opens more root key management options.

Encrypt Your Entire Database (GA Release)

Database Encryption is generally available worldwide. It began its deployment in Winter '26. Due to the pace of the controlled release, some regions lagged in enabling the new feature. Database Encryption allows you to sort, filter and reference encrypted data without functional or performance tradeoffs. You can still apply Field Level Encryption to individual fields if required.

Bring Your Own Key to Data 360

Platform Encryption for Data 360 customers can now make use of the Bring Your Own Key (BYOK) feature of Shield Platform Encryption. When you supply your own root key, you get the benefits built into Salesforce Shield Platform Encryption, plus the extra assurance that comes from exclusively managing your own key material. For Data 360, BYOK supports root keys only. Data 360 then manages all DEK creation and wrapping using the root key. To be compatible with Salesforce BYOK, use a PKCS#8 encrypted, Base64 encoded 4096 RSA key pair with appropriate headers and footers.

Encrypt Your Entire Database (GA Release)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Database Encryption is generally available worldwide. It began its deployment in Winter '26. Due to the pace of the controlled release, some regions lagged in enabling the new feature. Database Encryption allows you to sort, filter and reference encrypted data without functional or performance tradeoffs. You can still apply Field Level Encryption to individual fields if required.

Where: This change applies to Lightning Experience and Salesforce Classic (not available in all environments) in Enterprise, Performance, Unlimited, and Developer editions using Hyperforce in a cell where Database Encryption is enabled.

Note Database Encryption is now generally available. The feature is being deployed to all Hyperforce instances.

How: In your org, on the Encryption Settings page, choose the **Encrypt the Transactional Database** toggle. Salesforce begins encrypting data with your tenant-specific Shield key. Your other encryption settings (Fields and Files, Search Indexes, and Event Log Data) are unchanged.

Bring Your Own Key to Data 360

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Optimize your security posture with centralized alerting across all tenants and enhanced visibility into Login Anomalies via dedicated dashboards. Gain deeper insights into permission assignments while streamlining response times through consolidated investigations and automated remediation plans.

Monitor Login Anomaly Events Across Environments

A new Login Anomaly event is now available in the Threat Detection metric and dashboard, significantly enhancing the monitoring of suspicious logins.

New Permission Metrics for Comprehensive Monitoring

Gain more granular control and deeper security insight with new permission metrics. Monitor expanded permission assignments, including details on when and how a permission was assigned, covering security, connected applications, and AI agents.

Set Alerts at the Child Tenant Level

Set up alerts easily across all organizations, whether they are parent or child tenants.

Monitor Login Anomaly Events Across Environments

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

A new Login Anomaly event is now available in the Threat Detection metric and dashboard, significantly enhancing the monitoring of suspicious logins.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Who: This change applies to customers with Event Monitoring and the Security Center add-on subscription.

Why: This change significantly improves visibility and control over an organization's security posture.

How: In Setup, select Event Manager and enable streaming on Login Anomaly events. View the new events in the Security Center's Threat Detection dashboard, located on the Security Landscape page. Event details can be reviewed in the Threat Detection metric found under Monitoring in the Dashboard tab.

New Permission Metrics for Comprehensive Monitoring

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. [AI Agents for Service Cloud](#)

With the AI Agents for Service, employees quickly complete common business tasks with Agentforce Employee Agent, and service reps close cases faster using case resolution guidance provided by Agentforce Service Assistant.

[Case Management](#)

Give your reps enhanced tools to streamline case management and accelerate communication. Provide instant context through a unified Case Timeline, Quick Text for standardized responses, and original attachment visibility directly on the case record.

[Channels](#)

[TBD]

[Customer Signals Intelligence](#)

Get going faster with a more streamlined setup experience. Empower your reps to address customer needs more effectively with real-time insights. Updated prompts that you can further edit for your specific business needs. Enable faster performance for large data volumes with improved capacity and higher processing limits while reducing costs.

[Einstein for Service](#)

Get role-based, AI-generated case overviews with Enhanced Summaries. Track the adoption of Einstein for Service and monitor operational KPIs with the Service AI Adoption & Analytics dashboard. Switch to Enhanced Summaries, as Work Summaries for Case (beta) is scheduled for retirement on June 30, 2026.

[Einstein Service Replies](#)

Translate customer replies to inquiries automatically, and have your service reps responses translated automatically for customers.

Entitlements and Milestones

Define rules to automatically pause milestone timers when the next step is outside a service rep's control. Use Agentforce SLA Summary for comprehensive performance analytics. Get real-time visibility into milestone status across parent and child records to ensure better coordination and alignment across all teams contributing to resolution.

Feedback Management

Enable deeper customization and reliability for your surveys. Drive brand consistency using Custom CSS for flexible styling, and ensure better readability on desktops and small screens with the revamped Matrix Survey Question View. You can now configure partial response saving for up to 999 days, and save partial responses automatically for unauthenticated guest users.

HR Service

Onboard new users with Unified Employee License (UEL), a standard license with simplified administration and wall-to-wall coverage that expands feature support for new users. Provide a trusted channel for all employees with confidential case reporting for secure management of workplace issues.

Knowledge

Organize articles hierarchically with Knowledge Maps for easier navigation. Create knowledge articles efficiently with the enhanced Lightning Article Editor. Unified Knowledge retires in Summer '26, so migrate to Data 360 connectors.

Self Service

Deliver smarter, more efficient customer service with improved proactive detection, AI-guided troubleshooting, real-time personalization, and streamlined Self-Service. Enhanced detection tools, interactive troubleshooting, unified profiles, Activity Timelines, and a personalized Pending Task banner create more contextual experiences, while Agentic Portals offer accurate session-based AI billing and faster Dynamic Q&A, boosting responsiveness and reducing support needs.

Service Adoption

Learn about changes we're making to the Service Setup app and Service Setup Assistant.

Routing

Save time and effort by automatically routing work items with Omni-Channel. Take advantage of the latest features to achieve optimal results.

AI Agents for Service Cloud

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With the AI Agents for Service, employees quickly complete common business tasks with Agentforce Employee Agent, and service reps close cases faster using case resolution guidance provided by Agentforce Service Assistant.

Agentforce Service Assistant

Expand the capabilities of Agentforce Service Assistant by adding the Case Feed and Messaging Session and Voice Call records as grounding sources to improve service plan accuracy and relevance. We've also added translation support, allowing service plans to be presented in the service rep's preferred language.

Agentforce Employee Agent

Master SLA performance and compliance with the comprehensive Agentforce SLA Summary.

Agentforce Service Assistant

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Expand the capabilities of Agentforce Service Assistant by adding the Case Feed and Messaging Session and Voice Call records as grounding sources to improve service plan accuracy and relevance. We've also added translation support, allowing service plans to be presented in the service rep's preferred language.

Draft Service Plans in Service Rep's Preferred Language

Have service reps work Cases faster using service plans that are translated into their preferred language. When service reps draft a service plan, the plan is generated in your company's preferred language. Additionally, when have Real-Time Translations enabled, the service plan is then translated into the service rep's preferred language.

Use Case Feed as the Latest Grounding Source to Strengthen Service Plans

Adding Case Feed data to Service Assistant improves the accuracy and relevance of Service Plans. This richer, more contextual case activity enables the assistant to deliver more informed, relevant recommendations.

Add More Context to Service Plans with Messaging Session and Voice Call Record Grounding

Enhance the accuracy and details of service plans by grounding Service Assistant in Messaging Session and Voice Call records. When these records are attached to a case, Service Assistant analyzes the transcripts to create a case summary that summarizes what took place in the conversation and drafts a service plan that continues from where the conversation ended. The grounding process boosts rep productivity by ensuring the service plan continues exactly from where the prior interaction left off and avoids repeating steps and manual context gathering.

Draft Comprehensive Service Plans with Expanded Data Access

Service Assistant now drafts all service plans based on the permissions of the ServicePlanner User (the digital agent), rather than the individual service rep. This ensures that every service plan contains the most detailed information, regardless of an individual rep's field-level access or sharing rules.

Draft Service Plans in Service Rep's Preferred Language

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Have service reps work Cases faster using service plans that are translated into their preferred language. When service reps draft a service plan, the plan is generated in your company's preferred language. Additionally, when have Real-Time Translations enabled, the service plan is then translated into the service rep's preferred language.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions.

- Translation of service plans into your company's default language is available with Einstein for Service, Agentforce for Service, and Agentforce 1 editions.
- Translation of service plans into your service reps preferred language is available only with Agentforce for Service and Agentforce 1 editions.

Who:

- Translating and viewing service plans in your company's preferred language is available for all users by default.
- To turn on Real-Time Translations for Service Assistant, Salesforce admins need the Service Planner Builder permission set.
- To view service plans in their preferred language, service reps need the Service Plan Translation and Service Plan User permission sets.

Why: Previously, service plans only supported English, which slowed down service reps who weren't fluent in English. Now, service plans are translated to provide native-language clarity so service reps work faster and efficiently. Specifically:

- Service Assistant automatically drafts service plans in your company's preferred language when the language is supported in Prompt Builder. See [Supported Languages in Prompt Builder](#).
- When the Real-Time Translations feature is turned on, Service Assistant translates service plans into your service reps' preferred language. Service Assistant supports the same languages as Real Time Translations. See [Real-Time Translations](#).

Use Case Feed as the Latest Grounding Source to Strengthen Service Plans

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Adding Case Feed data to Service Assistant improves the accuracy and relevance of Service Plans. This richer, more contextual case activity enables the assistant to deliver more informed, relevant recommendations.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Einstein for Service, Agentforce for Service, and Agentforce 1 editions.

When: This feature is part of the Spring '26 release.

Who: To enable Case Feed Grounding for Service Assistant, Salesforce admins need the Service Planner Builder permission set.

To draft service plans with information from Case Feed, service reps need the Service Planner User permission set. This set provides Service Assistant Agents with automatic access to the Case Feed object to retrieve data.

How: From Setup, in the Quick Find box, enter and select **Service AI Grounding**. On the Service AI Grounding Setup page, under Additional Object Grounding Options, select **Include Case Feed** and save your changes.

Add More Context to Service Plans with Messaging Session and Voice Call Record Grounding

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enhance the accuracy and details of service plans by grounding Service Assistant in Messaging Session and Voice Call records. When these records are attached to a case, Service Assistant analyzes the transcripts to create a case summary that summarizes what took place in the conversation and drafts a service plan that continues from where the conversation ended. The grounding process boosts rep productivity by ensuring the service plan continues exactly from where the prior interaction left off and avoids repeating steps and manual context gathering.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Einstein for Service, Agentforce for Service, and Agentforce 1 editions.

When: This feature was originally released on December 18, 2025. We've included it in the Spring '26 Release Notes to increase the visibility of the feature.

Who:

- To set up Messaging Session and Voice Call record grounding for Service Assistant, Salesforce admins need the Service Planner Builder permission set.
- To ground service plans in Messaging Session or Voice Call records, the ServicePlanner User needs the Conversation Grounding Access custom permission set that has these permissions.
 - App permission: Access Conversations Entries, View All Voice and Video Calls
 - Messaging Session object permission: Read, View All Records
- To view Messaging Session or Voice Call information in a service plan, service reps need the Service Planner User permission set.

Why: By automatically grounding the case summary and service plan in the related conversation transcript, Service Assistant limits the need for service reps to manually review and synthesize the Messaging Session or Voice Call record. In addition, the service plan starts from where the original conversation ended, which speeds up case resolution and prevents the duplication of resolution steps already taken the conversation.

Conversation Ended [End Chat](#)

Hi, I'm planning a trip and I'm totally confused. I don't know if I need a visa for my destination or where to even apply for one. I also keep seeing different requirements about vaccinations, proof of accommodations, and needing specific financial funds. Can you help me figure this out?

Guest • 10/22/2025, 2:37:44 PM

[OrgFarm E](#) joined the conversation • 02:37:50 PM EDT

Hi Craig - I can certainly help clear that up. I'm Leo. It can definitely be confusing, but I can guide you through it. To get you the right information, I just need two key details:

[OrgFarm E](#) • 10/22/2025, 2:39:19 PM

**What is your destination country?
What is your nationality (what passport will you be traveling on)?**

[OrgFarm E](#) • 10/22/2025, 2:39:33 PM

I am a US citizen and I am planning to travel to Kenya for a 25-day safari.

[Jump to most recent](#)

[Reply to message](#)

Conversation Ended [End Chat](#)

Okay, I've confirmed the requirements. For a 25-day trip to Kenya, you do require an e-Visa, which must be applied for in advance. You will also need proof of a Yellow Fever vaccination. The application will also ask for proof of your accommodations and travel plans. Here is a document that outlines these requirements and more.

Thanks. I read through the document. An e-Visa is required. How do I apply for that, and what documents do I need for everything? I'm worried I'll miss something.

Guest • 10/22/2025, 2:53:05 PM

This involves a few important documents, so to make this easy, I'm going to create a formal Travel Documentation Case for you. This lets us track everything, provide you with a detailed checklist, and securely review your documents before you submit them to the embassy. Is that okay

Yes, please. A checklist would be perfect.

[Jump to most recent](#)

Service Plan

Travel Documentation Cases In Progress

Craig, a US citizen planning a 25-day safari trip to Kenya, sought assistance with travel documentation. **The agent provided guidance** on e-Visa requirements, vaccinations, and necessary documents, **created a formal case** with a checklist and secure portal link, **and advised** on avoiding non-refundable bookings until e-Visa approval.

Created on 10/22/2025, 12:23 PM

[Redraft Plan](#)

Gather Information

- ☐ Verify with Craig if all required documents, including proof of travel, proof of accommodations, and Yellow Fever vaccination proof, are ready for submission.
- ☐ Explain how to submit the application through the official Kenya e-Visa website and the company's travel verification portal.

Work

- ☐ Review the uploaded documents in the portal to ensure they meet the requirements. Confirm any missing or incorrect documents.

Resolve

- ☐ Provide Craig with a follow-up plan, including the expected e-Visa processing time (10-15 business days) and embassy contact information for inquiries.

Wrap Up

- ☐ Thank Craig for using the company's service and provide a link to the customer feedback survey to improve future assistance.

How: Assign your users the required permissions and then turn on **Messaging and Voice record grounding** in the Case tab of the Service Assistant Setup page.

Turn on Messaging and Voice Record Grounding Optional

Draft Comprehensive Service Plans with Expanded Data Access

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Service Assistant now drafts all service plans based on the permissions of the ServicePlanner User (the digital agent), rather than the individual service rep. This ensures that every service plan contains the most detailed information, regardless of an individual rep's field-level access or sharing rules.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions with Einstein for Service, Agentforce for Service, and Agentforce 1 editions.

When: This feature was originally released on December 18, 2025. We've included it in the Spring '26 Release Notes to increase the visibility of the feature.

Who: This change applies to the ServicePlanner User and service reps.

Why: Previously, plans were drafted based on the service rep's permissions, which could limit the inclusion of relevant data based on field-level access, object access, and sharing rules. For example, by using the ServicePlanner User's permissions for plan generation:

- Service plans now include all fields and object information set in your Service AI Grounding configuration, even if the service rep doesn't have field-level access.
- Plan steps are always grounded in your relevant knowledge articles, even when the service rep doesn't have access to the articles used to create the plan.

How: The feature is enabled by default, so no action is required. However, you should review your configurations for all grounding sources. To learn more about how permissions determine data access for each Service Assistant feature, see [Service Assistant Grounding Data Access](#).

Quickly identify risk indicators, monitor average response and resolution times against defined targets, and identify records that are closest to missing an SLA.

Where: This change applies to Lightning Experience in Professional, Enterprise, Performance, Unlimited, and Developer editions with the Service Cloud with the Agentforce Employee agent add-on.

Who: Agentforce SLA Summary is available to admins and supervisors.

How: From Setup, find and select **Agentforce Agents**. Open Agentforce Employee Agent in Builder and add the SLA Insights topic to it. Save, test, and activate the agent.

Case Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

available products and features.

Give your reps enhanced tools to streamline case management and accelerate communication. Provide instant context through a unified Case Timeline, Quick Text for standardized responses, and original attachment visibility directly on the case record.

Gain Instant Case Context with Case Timeline

Give your reps a single, unified, and intelligent timeline component for cases. This new component replaces the current fragmented collection of feeds and related lists with a single curated view of case-related events. Reps get instant context with a proactive workspace that intelligently organizes customer conversations, internal team collaboration, and key case milestones. The new timeline brings together channels like emails, chats, and messages into a clean, threaded view.

Use Quick Text in Case Comments

With Quick Text, reps can quickly add predefined text snippets, including dynamic merge fields to Case Comments. Quick Text standardizes internal and external communication, keeps notes consistent, and saves time by reducing repetitive manual typing.

Easily View Original Case Attachments

Reps can now view the original case attachments directly from the case details page. Original attachments include any files added by the customer in the initial message at the time of case creation. This feature eliminates the need for reps to navigate to the Attachments related list to locate these files.

Enhance Your Security of Organization-Wide Email Addresses

Organization-Wide Email Addresses (OWA) are now required to be verified before sending Case emails with custom content. This security enhancement prevents unauthorized use of the <noreply@salesforce.com> address and protects against potential phishing attempts.

Gain Instant Case Context with Case Timeline

This release is in preview

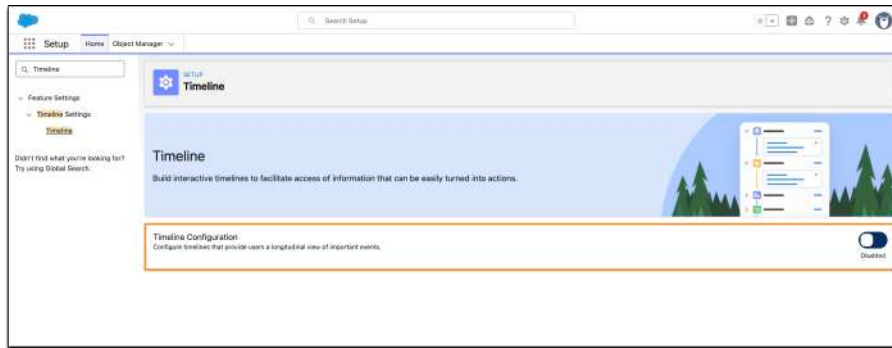

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your reps a single, unified, and intelligent timeline component for cases. This new component replaces the current fragmented collection of feeds and related lists with a single curated view of case-related events. Reps get instant context with a proactive workspace that intelligently organizes customer conversations, internal team collaboration, and key case milestones. The new timeline brings together channels like emails, chats, and messages into a clean, threaded view.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions where Industries Service Excellence is enabled.

Why: Reps spend too much time navigating disparate systems and sifting through data to find critical information, which causes information fatigue and slower resolution times. Without immediate insight into case progress or historical data, it's hard for reps to prioritize effectively and identify root causes. The new timeline gives a scannable, easy-to-understand view of all activity. It visually distinguishes owner changes, SLA breaches, and escalations as clearly marked milestones. Pre-configured Timeline Templates are available immediately for use in the Timeline feature, requiring no configuration.

How: In Setup, in the Quick Find Box, find and select **Timeline**. In the Timeline window, turn on the Timeline Configuration.

Use Quick Text in Case Comments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With Quick Text, reps can quickly add predefined text snippets, including dynamic merge fields to Case Comments. Quick Text standardizes internal and external communication, keeps notes consistent, and saves time by reducing repetitive manual typing.

Where: This change applies to Lightning Experience in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: This capability extends the efficiency and standardization benefits of Quick Text to internal collaboration tools along with external tools. Admins create and store Quick Text messages in shared folders. Reps can insert these messages which can contain dynamic merge fields, like `Contact.FirstName` that are automatically replaced with data based on the related case contact.

How: From Setup, in the Quick Find box, enter and select Quick Text Settings. Turn on Quick Text on the Quick Text Settings page. For Case Comments, admin must also turn on the **Rich Text for Case**

Comments org preference in Support Settings. Your reps can access Quick Text by using the insert button or the Quick Text icon in the Case Comments editor.

[Salesforce Help: Standardize Responses with Quick Text](#)

Easily View Original Case Attachments

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Reps can now view the original case attachments directly from the case details page. Original attachments include any files added by the customer in the initial message at the time of case creation. This feature eliminates the need for reps to navigate to the Attachments related list to locate these files.

Where: This change applies to Lightning Experience in Essentials, Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: Reps can lose case context if they can't view the attachments in the initial customer message. The Attachments related List doesn't distinguish between attachments added during case creation and those added later. This feature makes it easier for reps to view the original attachments, improving case context and productivity.

How: The feature is turned on by default and is visible to all reps who have access to the case record and attachments. To turn it off, contact your Salesforce Customer Support.

On the Case Details page, click **See Attachments** to open the Original Attachments panel. To see all attachments, click **View All Attachments**.

Enhance Your Security of Organization-Wide Email Addresses

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Organization-Wide Email Addresses (OWA) are now required to be verified before sending Case emails with custom content. This security enhancement prevents unauthorized use of the <noreply@salesforce.com> address and protects against potential phishing attempts.

Where: This change applies to all Salesforce editions that support Case email functionality.

Why: This security update ensures that all customers configure and verify their Organization-Wide Email Address before sending Case emails containing custom content. Previously, some organizations could bypass this requirement, creating a security risk where unauthorized users could potentially send malicious emails using the trusted @salesforce.com domain. This enhancement closes that security gap by enforcing verification requirements across all organizations.

How: If you've already configured and verified your Organization-Wide Email Address, no action is needed. If you haven't set up your Organization-Wide Email Address or if your current setup wasn't previously enforced, you must configure a verified Organization-Wide Email Address before sending emails with custom content. For setup instructions, see [Set Up Organization-Wide Email Addresses](#) in Salesforce Help.

Enhancements include new and updated features for Service Email.

Email Across Languages with Real-Time Translations

Let service reps translate Service Email conversations, expanding customer support across languages. A rep can translate an end user's email into the rep's language, as well as translate their response into the end user's language before sending. Previously, a Service Email rep had to speak the same language as an end user in order to assist.

Agent Session Continuity is Improved for Case-Related Email Threads

An Agentforce Agent session now remains associated with a case and all of its related emails over a three-day period. This preserves crucial information and context variables, such as user verification status or variables set by previous actions. Previously, a new session was opened for every inbound email, causing AI to lose conversation history and requiring repeated reinterpretation of earlier interactions.

Inbound Limit for Service Agent Emails is Extended

Inbound emails handled by the Service agent count against your Agentforce for Service on Email daily transaction limit, which is 5,000 by default. You can ask Salesforce Customer Support to raise this limit. Previously, this checked against the org's single email limit, which is shared with Apex and flow emails.

Email Composer is Modernized with New Button Colors

As part of a TinyMCE upgrade, the email composer button icons changed from grey to blue. This brings the composer up to our Salesforce Lightning Design System standards.

Email Across Languages with Real-Time Translations

This release is in preview

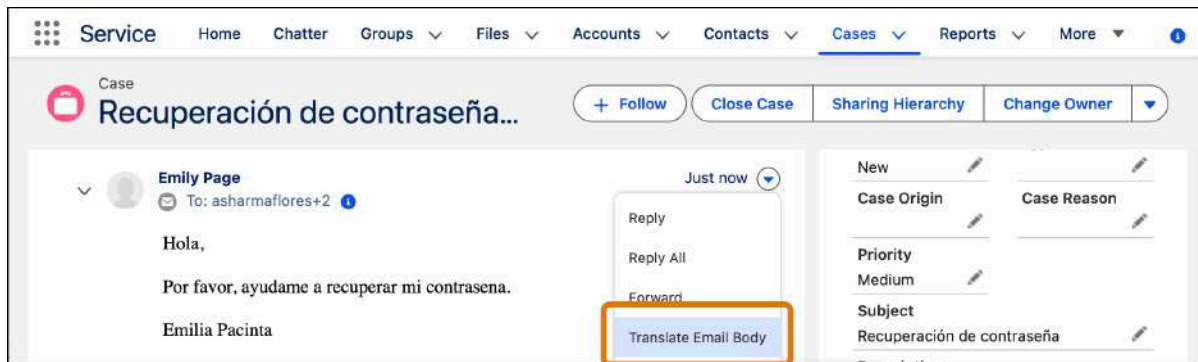

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Accept Clearer Terms and Conditions in Enhanced Chat

Read and accept a modernized Terms and Conditions page when you create a new Enhanced Chat channel or activate an inactive one. Get the information you need quicker with shorter, simplified text and links.

Save Money by Hiding the Real-Time Translations Preview Bar

Reduce calls to Agentforce Speech Foundation, each of which can consume flex credits if your free limit is reached, by hiding the Real-Time Translations preview bar. When the bar is hidden, a service rep won't see a translation preview as they type, but their message will be translated when sent to the end user, calling Agentforce Speech Foundation just once.

Protect Service Reps' Privacy in Business-Initiated Outbound Messaging

Replace your Service reps' first and last name with your Company Name in the disclaimer that's sent to a Message End User the very first time that you send them a Business-Initiated Outbound message. Use this in conjunction with Aliases to ensure that reps' private information is protected.

Educate Service Reps About Chat Exit Behavior

Enable confirmation modals to provide Service reps with more information about what happens when they select Leave Chat or End Chat in various scenarios.

Take Ownership of your Data Residency on Unified WhatsApp

Define the specific country or region where your WhatsApp data is stored at rest on Meta's side. By giving you control over data residency for each individual phone number, we help you meet your internal compliance and regulatory requirements.

Increase Familiarity and Rapport in WhatsApp with Read Receipts and Typing Indicators

Improve the transparency of a WhatsApp customer interaction by showing read receipts to Service reps and showing typing indicators to end users.

Review De-Duplication Activity for Unified WhatsApp

New logic ensures that you contact the most recently added individual in a Unified WhatsApp channel, and new error codes explain why other duplicate individuals weren't contacted. Previously, there wasn't logic to choose an Individual, and there weren't error codes to explain why we made the choice.

Bring Your Own Channel

Improve the experience for reps and messaging end users by exploring the latest enhancements and updates for Bring Your Own Channel for Messaging and Bring Your Own Channel for Contact Center as a Service (CCaaS).

Accept Clearer Terms and Conditions in Enhanced Chat

The image contains two screenshots of the Salesforce interface. The top screenshot is the 'Messaging Settings' page for a channel named 'Facebook Enhanced'. It shows various identifiers like Channel Name, Developer Name, Type, Messaging Platform Key, Messaging Channel ID, and Platform Type. A checkbox labeled 'Show business name as sender' is checked and highlighted with an orange box. The bottom screenshot is the 'Add or edit language' page. It has sections for 'Help Keywords' and 'Custom Keywords'. In the 'Help Keywords' section, the 'Help Response' text area is highlighted with an orange box. At the bottom right of this page are 'Cancel' and 'Save' buttons.

Educate Service Reps About Chat Exit Behavior

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enable confirmation modals to provide Service reps with more information about what happens when they select Leave Chat or End Chat in various scenarios.

Where: This applies to Enhanced In-App Chat and Enhanced Messaging. [View required editions.](#)

Why: We added confirmation modals to let Service Reps know what happens when they click **End Chat** in the following scenarios:

- Non-conference mode, agent clicks **End Chat**.
- Conference mode, owner clicks **End Chat** for all.
- Conference mode, participant (non-owner) clicks **Leave Chat**.

How: In the Lightning App Builder, open the Messaging Session page layout and click the Enhanced Conversation component. Select **Show chat exit confirmation**.

Take Ownership of your Data Residency on Unified WhatsApp

This release is in preview

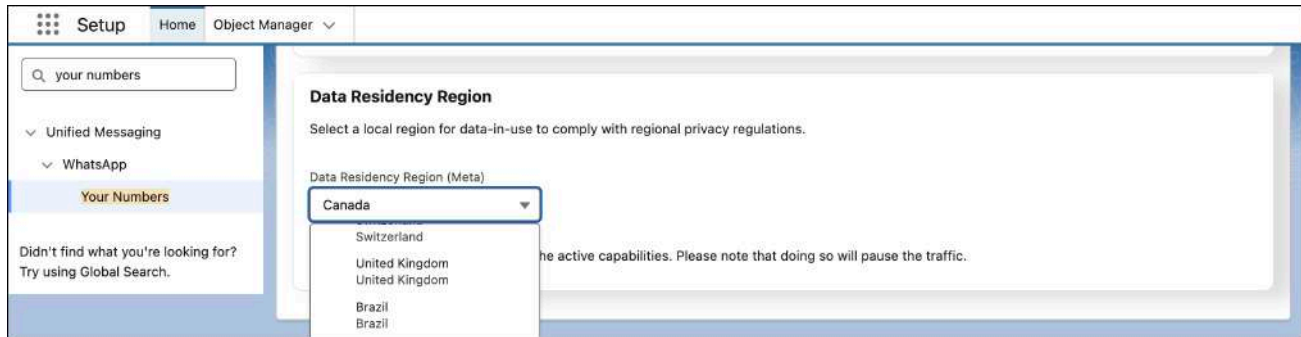

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Define the specific country or region where your WhatsApp data is stored at rest on Meta's side. By giving you control over data residency for each individual phone number, we help you meet your internal compliance and regulatory requirements.

Where: This applies to Unified WhatsApp in Enterprise and Unlimited Editions for Marketing Cloud Engagement Growth and Advanced Editions.

How: On the Your Numbers page in Setup, click to open the settings page for your Unified WhatsApp number. Deactivate any active capabilities, then make a selection from the Data Residency Region

(Meta) dropdown. After you receive a green confirmation message, reactivate your capabilities.

Increase Familiarity and Rapport in WhatsApp with Read Receipts and Typing Indicators

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve the transparency of a WhatsApp customer interaction by showing read receipts to Service reps and showing typing indicators to end users.

Where: This applies to Unified WhatsApp in Enterprise and Unlimited Editions for Marketing Cloud Engagement Growth and Advanced Editions. This change also applies to Service Cloud WhatsApp. [View required editions.](#)

Review De-Duplication Activity for Unified WhatsApp

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

New logic ensures that you contact the most recently added individual in a Unified WhatsApp channel, and new error codes explain why other duplicate individuals weren't contacted. Previously, there wasn't logic to choose an Individual, and there weren't error codes to explain why we made the choice.

Where: This change applies to Unified WhatsApp in Enterprise and Unlimited editions for Marketing

Cloud Engagement Growth and Advanced Editions.

Why: If a Unified Individual has multiple associated individuals, each with the same phone number, we only contact one Individual. We chose the latest Individual that was created with that phone number.

We introduced three new error codes to help explain why an individual wasn't contacted.

- SF-3025 - The message wasn't sent because the recipient's phone number wasn't a valid E.164 number. Correct the phone number and try again.
- SF-3045 - The message wasn't sent because the recipient's phone number is associated with a different individual ID.
- SF-3035 - The message wasn't sent because a contact record wasn't found.

How: To view the Individuals associated with a Unified Individual, and to see error messages explaining which Individuals were or weren't contacted, create a Data Cloud Data Explorer view. For a Data Lake Object view, add the Error Code and Not Sent Reason columns. For a Data Model Object view, add the Messaging Error Code and Error Message columns.

Bring Your Own Channel

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve the experience for reps and messaging end users by exploring the latest enhancements and updates for Bring Your Own Channel for Messaging and Bring Your Own Channel for Contact Center as a Service (CCaaS).

Improve Security in Bring Your Own Channel by Migrating to an External Client App

External client apps (ECAs) are the next generation of connected apps, designed to improve security and address packaging and distribution issues. While existing connected apps for Bring Your Own Channel integrations will continue to work, you won't be able to create new connected apps without first requesting the ability from Salesforce Support starting with Spring '26. This step is part of a Salesforce plan to eventually replace connected apps with ECAs. Consider migrating to an external client app for Bring Your Own Channel.

Maintain Service for Your Bring Your Own Channel Integration by Migrating Settings Fields

To improve the scalability of Bring Your Own Channel messaging services, we implemented changes to event-driven settings fields in the ConversationChannelDefinition and CustomMsgChannel objects. New fields are available in Winter '26 (API version 65.0), and old fields are removed in Spring '26 (API version 66.0). These are breaking changes.

Improve Security in Bring Your Own Channel by Migrating to an External Client App

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

External client apps (ECAs) are the next generation of connected apps, designed to improve security and address packaging and distribution issues. While existing connected apps for Bring Your Own Channel integrations will continue to work, you won't be able to create new connected apps without first requesting the ability from Salesforce Support starting with Spring '26. This step is part of a Salesforce plan to eventually replace connected apps with ECAs. Consider migrating to an external client app for Bring Your Own Channel.

Where: This change applies to Bring Your Own Channel for Messaging and Bring Your Own Channel for CCaaS. [View required editions.](#)

Who: This change impacts partners who create messaging provider integrations for Bring Your Own Channel for Messaging or Bring Your Own Channel for CCaaS. It also affects customers who have self-implemented Bring Your Own Channel for Messaging or manage their own authentication between Interaction Service API and their integration.

How: Inventory your connected apps and begin migrating to ECAs to prepare for the end of support. Use second-generation (2GP) packaging for an Bring Your Own Channel integration that uses an external client app. If you must create a new connected app, contact Salesforce Support to request access to this functionality.

Maintain Service for Your Bring Your Own Channel Integration by Migrating Settings Fields

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

To improve the scalability of Bring Your Own Channel messaging services, we implemented changes to event-driven settings fields in the `ConversationChannelDefinition` and `CustomMsgChannel` objects. New fields are available in Winter '26 (API version 65.0), and old fields are removed in Spring '26 (API version 66.0). These are breaking changes.

Where: This change applies to Bring Your Own Channel for Messaging and Bring Your Own Channel for CCaaS. [View required editions.](#)

Who: These changes impact partners who create messaging provider integrations for Bring Your Own Channel for Messaging or Bring Your Own Channel for CCaaS and customers who have self-implemented Bring Your Own Channel for Messaging. These changes also impact customers using partner-provided managed packages with removed fields. Customers must update their managed package to one that contains supported fields by Spring '26.

How: Learn more about the removed event-driven settings fields and assess whether your implementation requires updates to migrate to their replacements. Make required changes by Spring '26, when the fields will be removed.

- For `ConversationChannelDefinition`, deprecated fields are **`IsInboundReceiptsEnabled`**, **`IsRoutingWorkResultEnabled`**, and **`IsTypingIndicatorDisabled`**.
 - Use **`EventCapabilitiesIsInboundAcknwOptionExposed`** instead of **`IsInboundReceiptsEnabled`**.
 - Use **`EventCapabilitiesIsRoutingWorkResultSupported`** instead of **`IsRoutingWorkResultEnabled`**.
 - Use **`EventCapabilitiesIsTypingIndicatorOptionHidden`** instead of **`IsTypingIndicatorDisabled`**.
- For `CustomMsgChannel`, deprecated fields are **`HasInboundReceipts`** and **`HasTypingIndicator`**.
 - Use **`EventCapabilitiesIsInboundAcknowledgementEnabled`** instead of **`HasInboundReceipts`**.
 - Use **`EventCapabilitiesIsTypingIndicatorDisabled`** instead of **`HasTypingIndicator`**.

If you don't make required updates by Spring '26 or if customers use a managed package version with removed fields starting in Spring '26, your implementation will break.

Voice

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Explore the latest Service Cloud Voice enhancements that empower reps and supervisors to more efficiently and effectively resolve customer issues over the phone.

Scale Your VoiceCall Object with More Custom Fields

For greater flexibility, the maximum number of custom fields for the standard VoiceCall object is increased to 300. This update improves data capacity and avoids the architectural complexity of creating custom objects or polling other standard objects to store voice-related data.

Manage Contact Center Groups and Queues in Bulk

Save time and reduce manual data entry when managing your contact center. Admins can now use the Bulk API to create contact center groups and queues in bulk. This enhancement improves admin efficiency, supports large contact centers, and enables more comprehensive data management.

Add Flexibility to Unified Routing Transfers by Routing Calls to a Flow

Simplify the decision process for your reps by configuring voice call transfers with Omni-Channel Flows. This Omni-Channel Unified Routing enhancement unlocks more dynamic routing capabilities, allowing you to use complex business logic and skill-based criteria within a flow to determine the next transfer target.

Route Voicemails and Desk Phone Calls with Unified Routing

Unified Routing now supports voicemails and desk phone calls. This feature reduces wait times, improves rep productivity, and provides an efficient Omni-Channel experience. You can use this feature only if your telephony provider supports it.

Minimize Abandoned Calls with Queued Callbacks for Omni-Channel Unified Routing

Respect customers' time, save telephony minutes, and keep callers from abandoning their calls by giving them the option to request a callback without losing their place in a queue. When a rep accepts a contact request in Omni-Channel, an outbound call to the customer starts automatically. The initial inbound call, contact request, and outbound call are all linked for easy rep reference. This feature is available for contact centers using Omni-Channel Unified Routing.

Use Voicemail Drop for Outbound Calls (Beta)

When an outbound call reaches voicemail, you can disconnect the call to automatically leave your default pre-recorded message. While the system plays the message, you can move on to your next task immediately, increasing your productivity. You can record multiple messages and select one as your default.

Link Voice Calls to Their Source Records Automatically

When you initiate an outbound call by using Click-to-Dial from a custom object, or a contact role on a Case or Opportunity, the resulting VoiceCall record now automatically establishes a lookup relationship to the source record. This change removes the need for manual linking and reduces the need for customization with Flows or Apex triggers. Previously, this automatic linking was available only for Account, Case, Contact, Lead, Opportunity, CollectionPlan, and ContactRequest records.

Get Actionable Error Messages for Failed Outbound Calls

When an outbound call fails to connect, reps now have descriptive and actionable error messages directly in the Omni-Channel widget, which helps them to take immediate corrective action. This feature improves rep productivity and helps increase successful call connection rates.

Get the Latest Enhancements for Your Amazon Connect Contact Center

Update your contact center to version 20.0 to unlock the latest Service Cloud Voice features. This

version introduces a Lambda layer for running service health checks, and contact flows and subflows for voicemail drop. To test the updates before they go live in production, deploy them to your sandbox first.

[Update Your United States AWS Billing Address for Accurate Emergency Calling Fees](#)

As of March 1, 2025, AWS charges emergency calling fees for Amazon Connect based on the subaccount billing address. By default, Salesforce uses its own address for Service Cloud Voice with Amazon Connect customers with companies in the United States. To ensure correct charges and compliance with local regulations, update your AWS account to reflect your company's address instead.

Scale Your VoiceCall Object with More Custom Fields

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

For greater flexibility, the maximum number of custom fields for the standard VoiceCall object is increased to 300. This update improves data capacity and avoids the architectural complexity of creating custom objects or polling other standard objects to store voice-related data.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions. Available in Salesforce orgs with these [telephony models](#).

- Service Cloud Voice with Amazon Connect
- Service Cloud Voice with Partner Telephony from Amazon Connect
- Service Cloud Voice with Partner Telephony

Service Cloud Voice is available in Agentforce Sales (formerly Sales Cloud), Agentforce Service (formerly Service Cloud), and Government Cloud with the Service Cloud Voice add-on license. It's also available in Agentforce for Industries built from Sales or Service. [View supported editions](#).

Get the Latest Enhancements for Your Amazon Connect Contact Center

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Update your contact center to version 20.0 to unlock the latest Service Cloud Voice features. This version introduces a Lambda layer for running service health checks, and contact flows and subflows for voicemail drop. To test the updates before they go live in production, deploy them to your sandbox first.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions. Available in Salesforce orgs with these [telephony models](#).

- Service Cloud Voice with Amazon Connect
- Service Cloud Voice with Partner Telephony from Amazon Connect

Service Cloud Voice is available in Agentforce Sales (formerly Sales Cloud), Agentforce Service (formerly Service Cloud), and Government Cloud with the Service Cloud Voice add-on license. It's also available in Agentforce for Industries built from Sales or Service. [View supported editions](#).

Note Voicemail Drop is a pilot or beta service that is subject to the Beta Services Terms at [Agreements - Salesforce.com](#) or a written Unified Pilot Agreement if executed by Customer, and

applicable terms in the [Product Terms Directory](#). Use of this pilot or beta service is at the Customer's sole discretion.

Why: Contact center version 20.0 includes several key capabilities:

- Introduces a contact flow and subflows to handle call disconnect events, and updates the Lambda function to fetch the default recording URL for voicemail drop.
- Introduces an S3 role to perform CRUD operations in the S3 bucket for voicemail drop.
- Provides an option to install a Health Check Lambda layer to run self-service checks for contact centers.
- Includes Lambda optimizations to support unified routing transfers.

Legacy chat is scheduled for retirement.

Legacy Chat Is Being Retired

Legacy chat is scheduled for retirement on February 14, 2026, and is in maintenance mode unit then. You can continue to use chat until that date, but we recommned transitioning to Messaging for In-App and Web for modernized customer communication. Messaging offers many of the chat features that you love plus asynchronous conversations that can be picked back up at any time.

Legacy Chat Is Being Retired

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Legacy chat is scheduled for retirement on February 14, 2026, and is in maintenance mode unit then. You can continue to use chat until that date, but we recommned transitioning to Messaging for In-App and Web for modernized customer communication. Messaging offers many of the chat features that you love plus asynchronous conversations that can be picked back up at any time.

Where: This change applies to Salesforce Classic and Lightning Experience in all editions.

How: As of February 14, 2026, legacy chat will be removed and you can't access or use chat. To avoid service interruptions to your customers, migrate to Messaging for In-App and Web before that date.

Customer Signals Intelligence

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally

available products and features.

Get going faster with a more streamlined setup experience. Empower your reps to address customer needs more effectively with real-time insights. Updated prompts that you can further edit for your specific business needs. Enable faster performance for large data volumes with improved capacity and higher processing limits while reducing costs.

Activate Customer Insights Faster

Get your system up and running faster with a streamlined, more reliable activation process. Enhancements to data processing give you faster recommendations, helping you take immediate, effective action. Easily turn channels on and off with the new channel activation options in setup.

Uncover Real-Time Insights During Customer Interactions

Give your reps and supervisors immediate visibility into customer interactions by showing sentiment for cases as they happen. This real-time intelligence helps your reps make quick decisions and respond effectively to customer needs.

Customize Out-of-the-Box AI Insights Prompts

Work with more accurate insights based on updated out-of-the-box insights prompts that are now more effective. Modify the out-of-the-box insights prompts to accommodate unique use cases based on your specific business needs. Easily adjust insights prompts and also quickly revert to default templates, leading to more relevant and actionable intelligence

Process Large Data Volumes

Scale your implementation to handle increased usage and larger data volumes without slowing down performance. Staging transformation, increased LLM processing limits, and the newly introduced Small Language Model (SLM), help reduce credit consumption and prevent activation failures during onboarding. Channel-specific data pipelines process data faster for your users.

Activate Customer Insights Faster

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get your system up and running faster with a streamlined, more reliable activation process. Enhancements to data processing give you faster recommendations, helping you take immediate, effective action. Easily turn channels on and off with the new channel activation options in setup.

Where: This change applies to Lightning Experience in Enterprise, Unlimited editions with Data Cloud enabled, and the Customer Exprc Intel add-on.

Who: To set up Customer Signals Intelligence, users need the Data Cloud Admin permission set.

How: Go to Customer Signals Intelligence setup and then follow the help documentation for more

information.

Uncover Real-Time Insights During Customer Interactions

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your reps and supervisors immediate visibility into customer interactions by showing sentiment for cases as they happen. This real-time intelligence helps your reps make quick decisions and respond effectively to customer needs.

Where: This change applies to Lightning Experience in Enterprise, Unlimited editions with Data Cloud enabled, and the Customer Exprc Intel add-on.

Who: To set up real-time insights, users need the Data Cloud Admin permission set.

How: To enable real-time insights for Case, from Customer Signals Intelligence setup, go to Set Up the Basics and turn on **Real-Time Insights**.

Customize Out-of-the-Box AI Insights Prompts

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Work with more accurate insights based on updated out-of-the-box insights prompts that are now more effective. Modify the out-of-the-box insights prompts to accommodate unique use cases based on your specific business needs. Easily adjust insights prompts and also quickly revert to default templates, leading to more relevant and actionable intelligence

Where: This change applies to Lightning Experience in Enterprise, Unlimited editions with the Einstein for Platform, or Einstein or Agentforce for Sales or Service add-on, or Agentforce Foundations, and with Data Cloud enabled and the Customer Exprc Intel add-on.

Who: To customize prompts, users need the Prompt Template Manager permission set.

How: From Prompt Builder, search for and open the prompt. Edit the prompt instructions and save your work as a new version.

Process Large Data Volumes

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Scale your implementation to handle increased usage and larger data volumes without slowing down performance. Staging transformation, increased LLM processing limits, and the newly introduced Small Language Model (SLM), help reduce credit consumption and prevent activation failures during onboarding. Channel-specific data pipelines process data faster for your users.

Where: This change applies to Lightning Experience in Enterprise, Unlimited editions with Data Cloud enabled, and the Customer Exprc Intel add-on.

Einstein for Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get role-based, AI-generated case overviews with Enhanced Summaries. Track the adoption of Einstein for Service and monitor operational KPIs with the Service AI Adoption & Analytics dashboard. Switch to Enhanced Summaries, as Work Summaries for Case (beta) is scheduled for retirement on June 30, 2026.

[Get Role-Based Case Overviews with Enhanced Summaries](#)

Quickly catch up on cases with dynamic, AI-generated summaries tailored to your specific role and context. By surfacing only the essential information, Enhanced Summaries helps service reps and managers see precisely what is required for their role, reducing the time spent interpreting data and driving quicker, more informed customer interactions.

Work Summaries for Case (Beta) Is Being Retired

Work Summaries for Case (beta) is scheduled for retirement on June 30, 2026, and is in maintenance mode until then. You can continue to use Work Summaries for Case (beta) until that date, but we recommend transitioning to Enhanced Summaries. Enhanced Summaries offers role-specific summaries and more summarization features, which will help your service reps work more efficiently.

Track AI Performance with Service AI Adoption & Analytics

Access business impact and adoption of Einstein for Service with a dashboard that directly correlates AI usage with operational key performance indicators (KPIs). Track agent performance by analyzing key metrics such as Average Handle Time (AHT) and As-Is Usage to identify where AI usage drives positive outcomes and efficiency. Use these insights to enhance decision-making, track ROI, manage AI features, and provide data-driven coaching for your service reps.

Get Role-Based Case Overviews with Enhanced Summaries

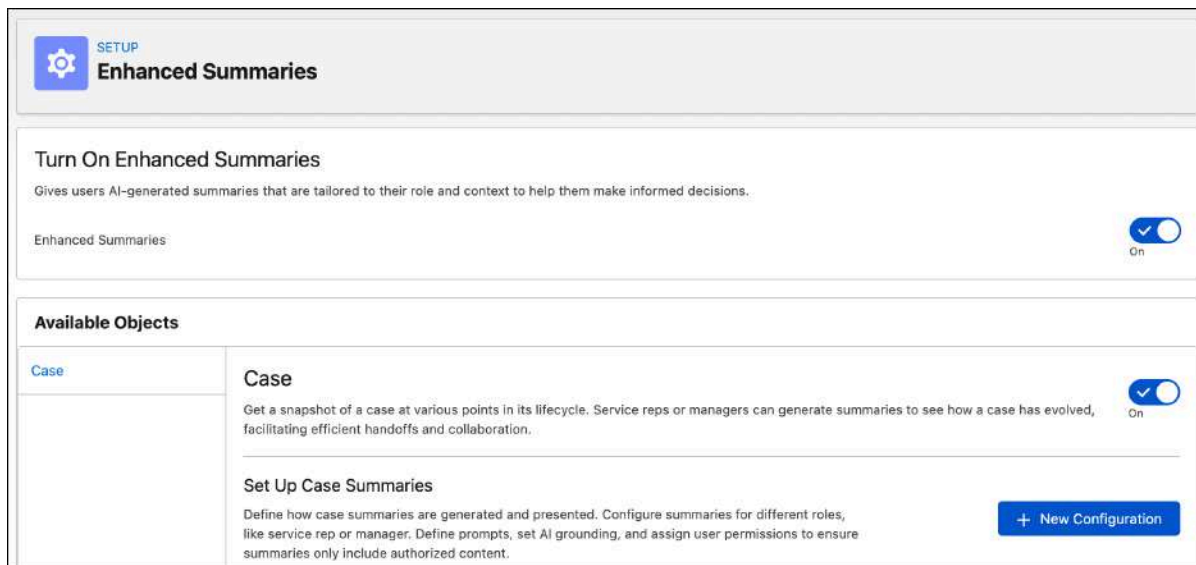

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Quickly catch up on cases with dynamic, AI-generated summaries tailored to your specific role and context. By surfacing only the essential information, Enhanced Summaries helps service reps and managers see precisely what is required for their role, reducing the time spent interpreting data and driving quicker, more informed customer interactions.

Where: This feature is available in Lightning Experience in Enterprise and Unlimited editions with the Agentforce for Service add-on or Agentforce 1 Edition. To purchase the Agentforce for Service add-on or Agentforce 1, contact your Salesforce account executive.

How: In Setup, go to the Enhanced Summaries page and turn on **Enhanced Summaries**. In the Available Objects section, on the Case tab, turn on the toggle for **Case**. Then, set up case summary configurations for different roles, such as Service Rep or Manager.

Track AI Performance with Service AI Adoption & Analytics

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Access business impact and adoption of Einstein for Service with a dashboard that directly correlates AI usage with operational key performance indicators (KPIs). Track agent performance by analyzing key metrics such as Average Handle Time (AHT) and As-Is Usage to identify where AI usage drives positive outcomes and efficiency. Use these insights to enhance decision-making, track ROI, manage AI features, and provide data-driven coaching for your service reps.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions of Service Cloud. It's also available in Einstein for Service Edition.

Who: The dashboards are part of the Einstein for Service analytics app. You need the Data Cloud admin permission set, Tableau Limited Viewer license and permission sets, and Service data kit.

Einstein Service Replies

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Translate customer replies to inquiries automatically, and have your service reps responses translated automatically for customers.

[Decrease Response Time for Global Service Representatives with Translate Service Replies](#)

Allow service representatives to translate end-user messages and their own responses before sending them. Service reps can now view customer replies in their local language, respond, and have that response translated back into the customer's preferred language.

Decrease Response Time for Global Service Representatives with Translate Service Replies

This release is in preview

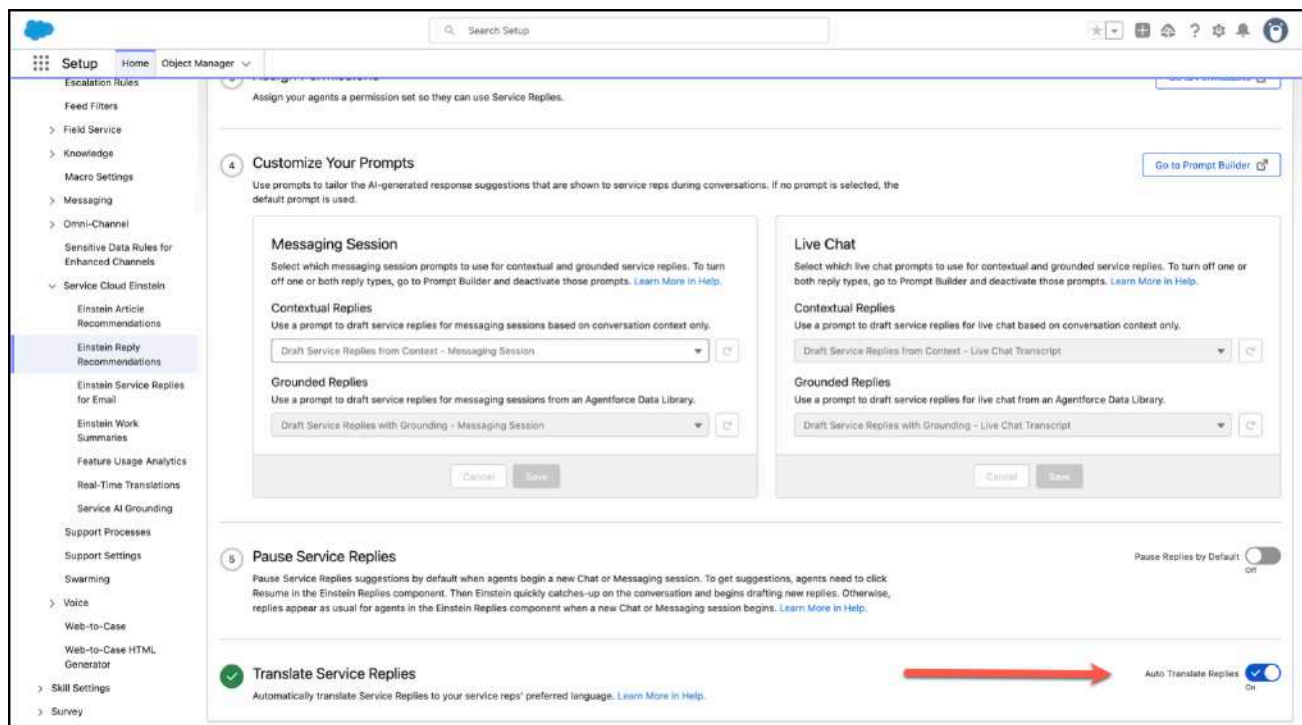

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Allow service representatives to translate end-user messages and their own responses before sending them. Service reps can now view customer replies in their local language, respond, and have that response translated back into the customer's preferred language.

Where: This change applies to Enterprise and Unlimited editions with the Agentforce for Service add-on, or to the Agentforce 1 Service Edition.

Who: Translate Service Replies is only available for customers with MIAW enabled and the Real Time Translation Permission set.

How: In Setup, under Einstein Service Replies, enable the Translate Service Replies toggle.

To translate a customer's message, click the Translate link that appears in the Service Console.

Entitlements and Milestones

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Define rules to automatically pause milestone timers when the next step is outside a service rep's control. Use Agentforce SLA Summary for comprehensive performance analytics. Get real-time visibility into milestone status across parent and child records to ensure better coordination and alignment across all teams contributing to resolution.

Improve SLA Reporting by Using Rule-based Milestone Pause

Free up your service reps from the manual overhead of stopping a record when the next step is outside their purview. Admins can set rules to automatically pause milestones when the defined conditions are met. For example, a milestone can be paused automatically if the case status is "Waiting for Customer." The milestone timer stops during the pause duration and resumes when the pause conditions change. The target date is reevaluated when the milestone unpauses. This helps with more accurate SLA reporting and clearly highlights delays.

Keep Departments Aligned on SLA Commitments with Bidirectional Milestone Visibility

Get real-time visibility into Service Level Agreements (SLAs) and Operation Level Agreements (OLAs) commitments and status by viewing milestones across parent and child records. This feature enables transparent, real-time visibility into child and parent milestone statuses. This allows for better coordination and alignment on SLA and OLA commitments and timelines when departments or vendors besides the service reps also contribute to resolutions.

Optimize SLA Compliance by Using Agentforce SLA Summary

Get a complete view of Service Level Agreement (SLA) adherence with Agentforce SLA Summary. Track key metrics like SLA breach data and trends, milestone performance, service rep performance and workload, and risk indicators. You can also monitor average response and resolution times against SLA targets, and see which records are close to missing an SLA.

Improve SLA Reporting by Using Rule-based Milestone Pause

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Feedback Management

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Enable deeper customization and reliability for your surveys. Drive brand consistency using Custom CSS for flexible styling, and ensure better readability on desktops and small screens with the revamped Matrix Survey Question View. You can now configure partial response saving for up to 999 days, and save partial responses automatically for unauthenticated guest users.

[Enhance Survey Readability with Revamped Matrix Questions View](#)

Improve survey readability on desktops and smaller screens with the revamped view for matrix questions. The new design presents options for each question in a dedicated dropdown menu, making it easier to read the full question and select an option.

[Save Partial Survey Responses for up to 999 days](#)

You can now save partially completed survey responses for up to 999 days, extending the time window from the previous 15-day limit. You can now configure this duration from anywhere between 1 and 999 days. The Partial Survey Settings are also located in the Default Settings.

[Save Partial Survey Responses from Guest Users](#)

Partially Completed Survey Responses are saved automatically for unauthenticated guest users. Previously, this functionality was available only for authenticated users.

[Customize Your Surveys with Custom CSS](#)

Cascading Style Sheets (CSS) offer flexible styling for your surveys. Custom CSS lets you define the fonts, colors, layout, padding between elements, and icon alignment and size of the survey beyond the default settings of the Survey Builder. You can use Custom CSS to create surveys that perfectly align with your branding.

Enhance Survey Readability with Revamped Matrix Questions View

This release is in preview

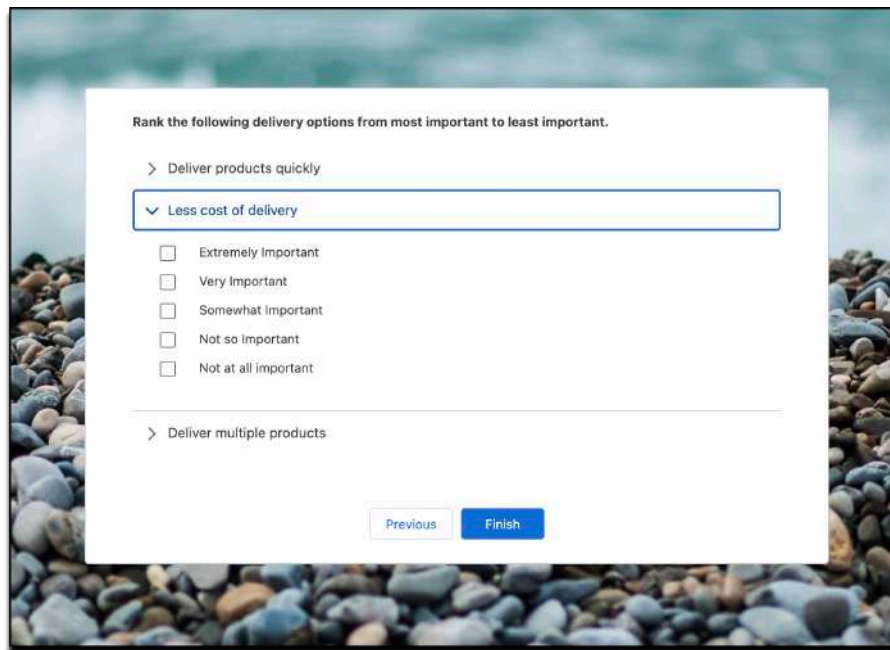

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Improve survey readability on desktops and smaller screens with the revamped view for matrix questions. The new design presents options for each question in a dedicated dropdown menu, making it easier to read the full question and select an option.

Where: This change applies to Lightning Experience and Salesforce Classic in Enterprise, Unlimited, and Developer Editions where Feedback Management - Starter or Feedback Management - Growth is enabled.

Why: The prior tabular format used for matrix questions presented multiple challenges for users, especially on smaller screens. The dense layout often required scrolling to view all selection options. Longer question text sometimes crowded the options, making both elements difficult to read. The redesigned view resolves these issues by giving each matrix question its own dropdown, which significantly enhances readability and simplifies the process of selecting options on mobile and desktop devices.

How: In the Survey Builder, click Add Question, and then select Matrix.

Rank the following delivery options from most important to least important.

> Deliver products quickly

▼ Less cost of delivery

☐ Extremely important

☐ Very important

☐ Somewhat important

☐ Not so important

☐ Not at all important

> Deliver multiple products

HR Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Onboard new users with Unified Employee License (UEL), a standard license with simplified

administration and wall-to-wall coverage that expands feature support for new users. Provide a trusted channel for all employees with confidential case reporting for secure management of workplace issues.

Improve Employee Experience with New Unified Employee License for HR Service

Accelerate HR Service adoption with Unified Employee License (UEL). UEL streamlines administration, delivers wall-to-wall employee coverage, and provides the right level of access for efficient work. It now includes Manager Provisioning along with support for Agentforce actions, employee provisioning, Unified Catalog items, and employee enablements.

Strengthen Employee Trust with Confidential Case Reporting

Give your employees a secure channel to report confidential workplace issues, such as harassment, discrimination, or misconduct. Employees can report these issues directly from the employee portal or with Agentforce. Agentforce detects sensitive language and creates a confidential case for tracking to ensure that the case is automatically flagged and discreetly routed only to authorized HR reps. Admins manage access and routing of cases based on case categories to ensure employee privacy and accurate resolution

Improve Employee Experience with New Unified Employee License for HR Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Organize articles hierarchically with Knowledge Maps for easier navigation. Create knowledge articles efficiently with the enhanced Lightning Article Editor. Unified Knowledge retires in Summer '26, so migrate to Data 360 connectors.

Organize Articles and Improve Navigation with Knowledge Maps (Generally Available)

Organize your knowledge articles into a hierarchical structure to make it easier for users to find and navigate content. This feature helps to keep your knowledge base consistent and well-structured, enhancing user experience and efficiency. This feature, which is now generally available, includes some changes since the pilot release.

Get More Done in the Lightning Article Editor

With the improved Lightning Article Editor, write knowledge articles more efficiently. Take advantage of the streamlined features to create top-notch content.

Unified Knowledge Is Being Retired

Unified Knowledge is scheduled for retirement in Summer '26. You can continue using it until then,

but we recommend migrating to Data 360 connectors to ingest your external knowledge into Salesforce, helping Agentforce deliver accurate responses. Data 360 connectors offer many of the features that you love from Unified Knowledge, plus improved file size handling, enhanced innovation, and better data storage and pipeline capabilities. Currently, they support Agentforce grounding, and more functionalities will be added before the expected deprecation.

Identify and Address Gaps in Your Knowledge Base with Self Learning Knowledge (Generally Available)

Self Learning Knowledge gathers and analyzes detailed customer data from channels like surveys, voice, chat, and cases to learn about customer behavior and preferences. Self Learning Knowledge uses the information in past cases and conversations to help your support team decide where to update or add information.

Organize Articles and Improve Navigation with Knowledge Maps (Generally Available)

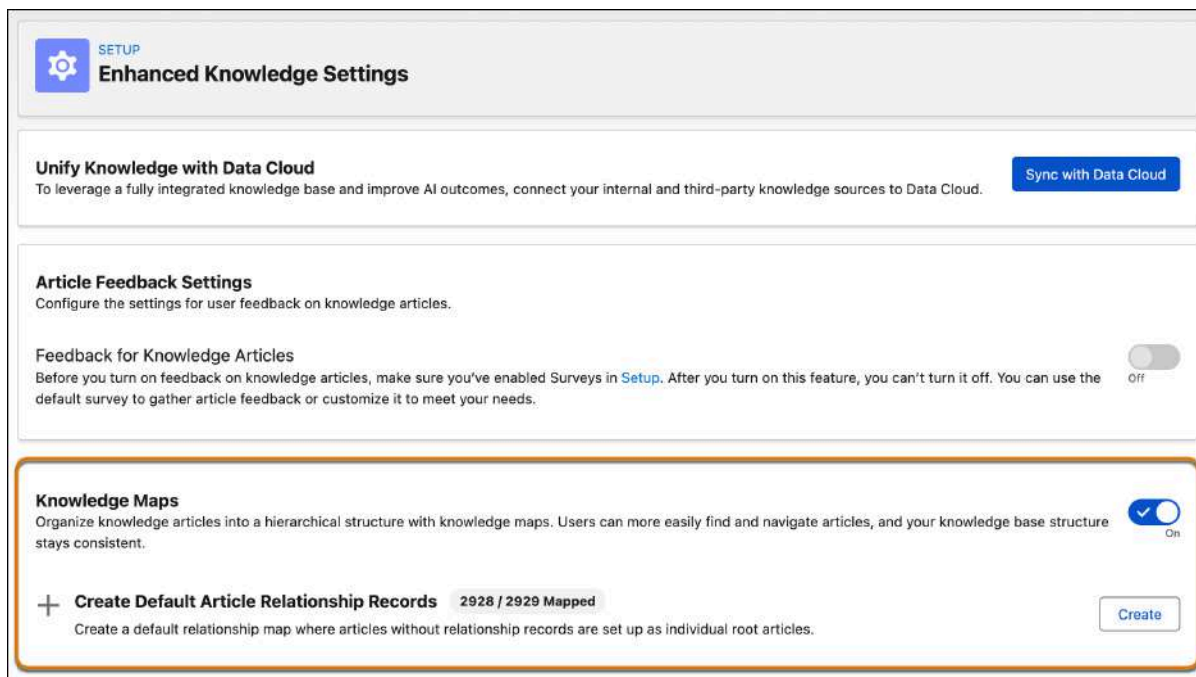

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Organize your knowledge articles into a hierarchical structure to make it easier for users to find and navigate content. This feature helps to keep your knowledge base consistent and well-structured, enhancing user experience and efficiency. This feature, which is now generally available, includes some changes since the pilot release.

Where: This change applies to Lightning Experience in Essentials, Professional, Enterprise, Unlimited, and Developer editions.

How: In Setup, go to the Enhanced Knowledge Settings page and turn on **Knowledge Maps**. Then, click **Create** to build a default relationship map to fill structural gaps in your knowledge base hierarchy where articles without relationships are set as individual root articles.

Get More Done in the Lightning Article Editor

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

With the improved Lightning Article Editor, write knowledge articles more efficiently. Take advantage of the streamlined features to create top-notch content.

Where: This change applies to Lightning Experience in Essentials, Professional, Enterprise, Unlimited, and Developer editions.

How: To help you write knowledge articles more efficiently, Lightning Article Editor has several key improvements.

Here are the general improvements.

- You can now use Dark Mode in the article editor, making it easier to edit content in low-light environments.
- Editing articles on the iPad is now easier. The expanded toolbar in narrow layouts no longer blocks your editing space, allowing full access to toolbar options while you edit.

- The editor toolbar is now visually consistent. Split buttons now match the size and look of the other buttons.
- You can now edit smart links in bulleted or numbered lists in knowledge articles without affecting the formatting of the list.
- You can now easily switch between numeric (1, 2, 3) and alphabetic (a, b, c) numbering styles in nested lists. Previously, switching from alphabetic back to numeric wasn't easy.
- We've resolved general formatting issues with numbered and bulleted lists in the article editor.
- The format and alignment of bulleted lists are now the same in the draft version and the published article.
- The paragraph spacing is now consistent in the article editor and accurately reflects the spacing in the published article.
- Anchor links in Knowledge articles now smoothly scroll to the target section, giving readers a better experience in long articles.
- In Chromium browsers like Chrome, Edge, Opera, and Brave, dragging content in the article editor caused unexpected scrolling. This issue is now fixed, making drag-and-drop much better.
- The tooltips on toolbar buttons now disappear as expected when you move your mouse away.

Here are the accessibility-related improvements.

- Screen reader users can now give article feedback more easily. Screen readers correctly announce “Was this article helpful?” when they reach the Like or Dislike buttons on the article.
- We increased the contrast ratio for non-text elements like icons, buttons, and borders in the article editor to meet accessibility standards, making the interface easier to use for users with low-vision.
- The article editor now shows the word count and includes ARIA label, making it easy for screen reader users to track their word count as they write.

Make your purchase decisions only on the basis of generally available products and features.

Unified Knowledge is scheduled for retirement in Summer '26. You can continue using it until then, but we recommend migrating to Data 360 connectors to ingest your external knowledge into Salesforce, helping Agentforce deliver accurate responses. Data 360 connectors offer many of the features that you love from Unified Knowledge, plus improved file size handling, enhanced innovation, and better data storage and pipeline capabilities. Currently, they support Agentforce grounding, and more functionalities will be added before the expected deprecation.

Where: This change applies to Lightning Experience in Unlimited Edition and all other editions with the Knowledge add-on license.

How: In June 2026, support for Unified Knowledge connectors will be removed and you won't be able to access or use Unified Knowledge connectors. To avoid service interruptions, migrate to Data 360 connectors before they retire.

Identify and Address Gaps in Your Knowledge Base with Self Learning Knowledge (Generally Available)

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Self Learning Knowledge gathers and analyzes detailed customer data from channels like surveys, voice, chat, and cases to learn about customer behavior and preferences. Self Learning Knowledge uses the information in past cases and conversations to help your support team decide where to update or add information.

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Professional Editions with Customer Signals Intelligence enabled.

How: From Setup, enter and select **Customer Signals Intelligence**, then under Set Up Self Learning Knowledge in Data Cloud, click **Install**.

Self Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Deliver smarter, more efficient customer service with improved proactive detection, AI-guided troubleshooting, real-time personalization, and streamlined Self-Service. Enhanced detection tools,

interactive troubleshooting, unified profiles, Activity Timelines, and a personalized Pending Task banner create more contextual experiences, while Agentic Portals offer accurate session-based AI billing and faster Dynamic Q&A, boosting responsiveness and reducing support needs.

Build Proactive Service Scenarios with the New Detection and Segmentation UI

Configure the what and who of proactive service scenarios with a new detection UI that helps you define event-based or scheduled triggers and dynamically identify affected customers. This capability completes the detection stage of the Proactive Service lifecycle and supports rule-based outreach powered by Data Cloud and event activity.

Guide Your Users Through Interactive Troubleshooting for Proactive Scenarios

Help service reps proactively resolve customer issues by generating AI-driven troubleshooting plans when no automation exists. Service reps define a scenario prompt during campaign planning, and Agentforce Service agent uses it to guide customers through a tailored troubleshooting session after they open an outreach. This approach broadens coverage of proactive issues, accelerates resolution, and captures conversation traces to improve future troubleshooting plans.

Give Your Users Personalized Self-Service with a Unified Customer Profile

Surface a real-time, unified customer profile to deliver personalized, context-aware self-service. You can read up-to-date attributes, activity history, and insights like sentiment and automatically write new activity data as users interact. Your users benefit from fewer forms to fill out, faster completion, and a more relevant self-service journey.

Help Experience Cloud Site Users Track Their History with a Personalized Activity Timeline

Give your Experience Cloud site users a clear view of their activity history with an in-page timeline that highlights logins, case updates, messages, Website Engagement, and Web Search Engagement events. They can quickly understand what has happened, where they left off, and what has changed since their last visit, without navigating multiple pages.

Guide Experience Cloud Site Users with a Proactive Pending Task Banner

The personalized Pending Task banner on the Experience Cloud site homepage helps users see and act on high-priority tasks as soon as they log in. These recommendations are based on the user's profile, recent activity, and AI-powered insights. For enhanced, insight-driven task recommendations, you can activate the new AI Experiences tile.

Bill AI Self-Service Usage More Accurately with Session-Based Tracking

Get more accurate billing for AI powered Self Service activity by tracking usage per authenticated login session. This feature groups all AI interactions, like Knowledge Article Summary or Dynamic Q&A within a single session, providing usage reports that reflect how customers engage with Agentic Portal features.

Improve Dynamic Q&A Performance with Persisted Questions and Answers for Authenticated Users

Dynamic Q&A now loads faster and reduces Large Language Model (LLM) calls by persisting generated questions and answers for authenticated users. Previously, Dynamic Q&A regenerated a new set of questions each time an authenticated user viewed an article. The feature now stores the generated questions, which improves performance and gives users quicker access to relevant answers.

Monitor Proactive Service Campaign Performance

Gain a unified view of your service campaign performance with the campaign analytics dashboard. You can monitor outreach, open rates, completion rates, bounce rates, and individual customer

progress to assess campaign health and week-over-week trends. Use these insights to identify issues, follow up with customers, and measure campaign return on investment (ROI).

Build Proactive Service Scenarios with the New Detection and Segmentation UI

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Configure the what and who of proactive service scenarios with a new detection UI that helps you define event-based or scheduled triggers and dynamically identify affected customers. This capability completes the detection stage of the Proactive Service lifecycle and supports rule-based outreach powered by Data Cloud and event activity.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer editions. Also, applies to Proactive Service Add-on, Proactive Service For Community Add-on, and Unified Catalog Add-on.

Who: This change is available to users with the ServiceDeskUser or Service User license, and those assigned Data Cloud or Service Cloud user licenses. Customers accessing Experience Cloud sites must have Customer Community Plus licenses.

Why: Proactive Service identifies customer-impacting issues before they are reported. The detection and segmentation UI makes it easier for you to set up event-based and scheduled-based detection, define affected customers, and prepare outreach and fulfillment plans more accurately. This enhancement improves detection quality, expands use cases, and ensures timely, targeted communications.

How: From the Proactive Service Detection and Segmentation page, select an **event** or **scheduled trigger**, define conditions, and generate the impacted-customer segment. In planning, configure the resolution method and Unified Catalog automation. During outreach, customers receive the scenario message and complete the linked fulfillment flow.

Guide Your Users Through Interactive Troubleshooting for Proactive Scenarios

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability

within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Help service reps proactively resolve customer issues by generating AI-driven troubleshooting plans when no automation exists. Service reps define a scenario prompt during campaign planning, and Agentforce Service agent uses it to guide customers through a tailored troubleshooting session after they open an outreach. This approach broadens coverage of proactive issues, accelerates resolution, and captures conversation traces to improve future troubleshooting plans.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer editions. Also, applies to Proactive Service Add-on, Proactive Service For Community Add-on, and Unified Catalog Add-on.

Who: This change is available to users with the ServiceDeskUser or Service User license, and those assigned Data Cloud or Service Cloud user licenses. Customers accessing Experience Cloud sites must have Customer Community Plus licenses.

Why: Service reps can now guide customers through interactive troubleshooting when no prebuilt automation exists. AI-driven plans walk customers through tailored steps to diagnose and resolve issues, reducing dependency on screen flows and providing conversation data to optimize future troubleshooting.

How: In the scenario configuration, select guided troubleshooting as the resolution method and provide a scenario prompt. When a customer opens the Experience Cloud site and the resolution type is interactive troubleshooting, Agentforce Service agent begins the session using the provided prompt. All interactions are captured automatically for analysis and optimization.

Give Your Users Personalized Self-Service with a Unified Customer Profile

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Surface a real-time, unified customer profile to deliver personalized, context-aware self-service. You can read up-to-date attributes, activity history, and insights like sentiment and automatically write new activity data as users interact. Your users benefit from fewer forms to fill out, faster completion, and a more relevant self-service journey.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer with Foundations or Agentforce 1 Editions. Access to some standard agent actions requires additional [add-on licenses](#).

Who: You must have access to the Experience Cloud site, Unified Catalog flows, or Agentforce Service

agent based on your existing site configuration.

Why: Self-Service journeys work best when they reflect each customer's history and current context. With access to profile attributes, behavioral activity, and computed insights, your Self-Service surfaces can adapt UI elements, prefill forms, and guide users more intelligently. Agentforce Service agent and Unified Catalog flows can draw on the same profile context to deliver consistent answers and reduce customer effort.

How: From Setup, configure your Self-Service surfaces to use the unified profile data model. Map customer profile fields to form inputs and enable activity writeback so new user actions appear in the customer's activity stream in real time.

Help Experience Cloud Site Users Track Their History with a Personalized Activity Timeline

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Give your Experience Cloud site users a clear view of their activity history with an in-page timeline that highlights logins, case updates, messages, Website Engagement, and Web Search Engagement events. They can quickly understand what has happened, where they left off, and what has changed since their last visit, without navigating multiple pages.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer editions

Who: Experience Cloud site users who have standard access to the site and permission to view their own activity feed.

Why: Customers often lose track of past interactions, leading to repeated questions and unnecessary support cases. A consolidated timeline helps users orient themselves, review progress, and resume tasks with confidence. By surfacing events such as logins, messages, case updates, Website Engagement, and Web Search Engagement, the timeline provides transparency and strengthens trust by giving users a full record of their engagement.

How: In Experience Builder, drag the **Timeline** component into your site's navigation area. Set up the component to show relevant events sourced from the user's unified profile, including logins, messages, case updates, Website Engagement, and Web Search Engagement.

Guide Experience Cloud Site Users with a Proactive Pending Task Banner

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

The personalized Pending Task banner on the Experience Cloud site homepage helps users see and act on high-priority tasks as soon as they log in. These recommendations are based on the user's profile, recent activity, and AI-powered insights. For enhanced, insight-driven task recommendations, you can activate the new AI Experiences tile.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer editions.

Who: This feature is available to authenticated users of Experience Cloud sites. Admins configuring the Pending Task banner must have permissions to manage Experience Cloud and Data Cloud personalization settings.

Why: A proactive Pending Task banner makes it easy by showing the most important action at the right time, improving task completion rates and lowering support volume. With context-driven logic, Experience Cloud site can guide users through critical steps automatically.

How: Add the Pending Task banner component to an Experience Cloud site homepage in Experience Builder. For the best user experience, Salesforce recommends placing the Pending Task banner in the header section of the page. If your site requires login to show personalized content, place the banner on an authenticated page. Set up rule criteria or context mappings to show the right tasks based on unified profile data and recent activity. You can also activate the AI Experiences tile toggle to surface enhanced, insight-driven task recommendations.

Bill AI Self-Service Usage More Accurately with Session-Based Tracking

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Get more accurate billing for AI powered Self Service activity by tracking usage per authenticated login session. This feature groups all AI interactions, like Knowledge Article Summary or Dynamic Q&A within a single session, providing usage reports that reflect how customers engage with Agentic Portal features.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer editions.

Who: This feature is available to authenticated users working in orgs that use Customer Community, Customer Community Plus, Customer Community Login, Customer Community Plus Login, and the corresponding unlimited login variants. Users must have access to Agentic Portal capabilities, including AI Knowledge Article Summary and Dynamic Q&A.

Why: Agentic Portals introduce AI-driven features that are often used together in a single visit. Tracking usage at the session level gives you clearer consumption data, reduces noise in billing reports, and aligns with the broader Self-Service monetization strategy. You get transparent usage records, easier auditing, and greater accuracy when customers operate within contractual AI usage limits.

How: Session based usage tracking records AI feature activity for each authenticated login session. During a session, all AI interactions are collected and combined into a single usage record. Billing entries are created on a daily or configurable schedule and include session details and aggregated activity. Usage logs and reports provide visibility into feature consumption.

Improve Dynamic Q&A Performance with Persisted Questions and Answers for Authenticated Users

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Dynamic Q&A now loads faster and reduces Large Language Model (LLM) calls by persisting generated questions and answers for authenticated users. Previously, Dynamic Q&A regenerated a new set of questions each time an authenticated user viewed an article. The feature now stores the generated questions, which improves performance and gives users quicker access to relevant answers.

Where: This change applies to Aura or LWR sites accessed through Lightning Experience and Salesforce Classic in Enterprise, Professional, Unlimited, and Developer editions.

Who: Available to authenticated Experience Cloud users with Customer Community or Customer Community Plus licenses. Also available to internal users with a Knowledge license when accessing knowledge-related features. Experience Cloud site builders need permissions to add and configure the Dynamic Q&A component in Experience Builder.

Why: In the previous release, Dynamic Q&A persisted questions and answers only for guest users. Authenticated users received newly generated questions on every request, which required repeated calls to the large language model and increased latency. With this enhancement, Dynamic Q&A now persists generated questions for authenticated users as well, which reduces repeated processing, lowers overall

Large Language Model (LLM) usage, and delivers faster article-level answers.

How: Dynamic Q&A now stores the generated set of questions and answers for authenticated users. When a user returns to the same article, the component shows the persisted questions instead of generating new ones. This reduces load times and avoids repeated calls to the Large Language Model (LLM). Component behavior and configuration in Experience Builder remain unchanged.

Monitor Proactive Service Campaign Performance

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Gain a unified view of your service campaign performance with the campaign analytics dashboard. You can monitor outreach, open rates, completion rates, bounce rates, and individual customer progress to assess campaign health and week-over-week trends. Use these insights to identify issues, follow up with customers, and measure campaign return on investment (ROI).

Where: This change applies to Lightning Experience in Enterprise, Unlimited, and Developer editions of Service Cloud.

Who: To create the app, you need the Data Cloud admin permission sets, Tableau Limited Viewer license and permission sets, and Service cloud data kit.

Service Adoption

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Learn about changes we're making to the Service Setup app and Service Setup Assistant.

Service Setup and Service Setup Assistant Retiring in New Orgs

In Salesforce orgs created in Spring '26 or later, including sandbox orgs, the Service Setup app and Service Setup Assistant will no longer be available. These features will still be available in maintenance mode in orgs created before Spring '26.

Service Setup and Service Setup Assistant Retiring in New Orgs

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

In Salesforce orgs created in Spring '26 or later, including sandbox orgs, the Service Setup app and Service Setup Assistant will no longer be available. These features will still be available in maintenance mode in orgs created before Spring '26.

Where: The Service Setup app and Service Setup Assistant were available in Professional, Enterprise, Performance, Unlimited, and Developer editions.

Why: For setup help with Service features, use Salesforce Go. Like Service Setup Assistant and the Service Setup app, Go offers onboarding and setup assistance for new Salesforce orgs.

In orgs created before Spring '26:

- If the Service Setup Assistant is already on, its sample data and configurations remain.
- If it isn't on yet, you can still turn it on to install the sample data and configurations.

Routing

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Save time and effort by automatically routing work items with Omni-Channel. Take advantage of the latest features to achieve optimal results.

Monitor Your Hybrid Service Team with Command Center for Service

Omni-Channel Supervisor is now Command Center for Service. Only the name has changed. You retain all the features and tools you already use to monitor your teams and optimize performance,

now available under Command Center for Service.

Route Voice Conversations to External Bots

Route voice conversations to your preferred external bots by using the Route Work action in Omni-Channel flows. You can use external bots that are tailored to your specific needs and preferences.

Monitor Your Hybrid Service Team with Command Center for Service

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

Omni-Channel Supervisor is now Command Center for Service. Only the name has changed. You retain all the features and tools you already use to monitor your teams and optimize performance, now available under Command Center for Service.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions.

Route Voice Conversations to External Bots

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

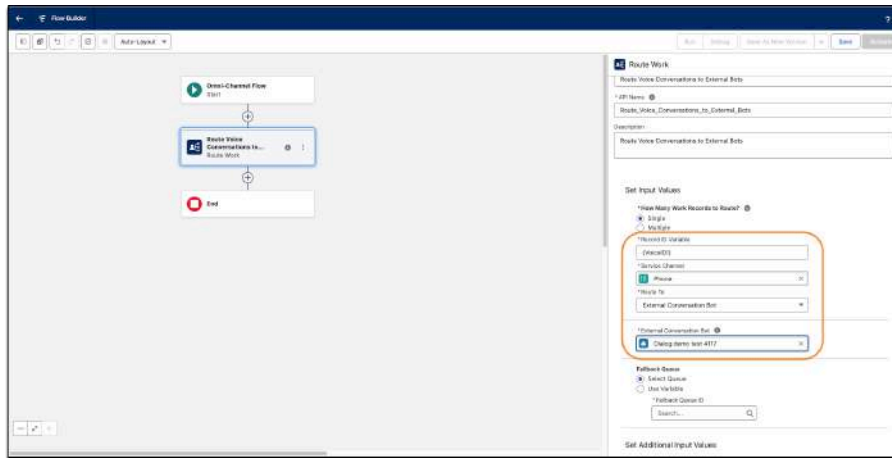

Route voice conversations to your preferred external bots by using the Route Work action in Omni-Channel flows. You can use external bots that are tailored to your specific needs and preferences.

Where: This change applies to Lightning Experience in Enterprise, Performance, Unlimited, and Developer editions with Foundations or Agentforce 1 Editions where Service Cloud Voice and Agentforce are enabled.

Why: AI agents answer questions 24/7, reducing wait times and improving accessibility for customers. AI agents handle frequently asked questions, enabling service reps to focus on more complex tasks. Integrate external bots, such as Google CCAI, and customize them to meet your specific business requirements.

How: In Setup, in the Quick Find box, find and select **Flows**. Select a flow or click **New Flow** to create a new flow. In Flow Builder, add **Route Work** action to the canvas. In the Route Work action, select **Phone**

as the Service Channel. In the Route To field, select **External Conversation Bot**, and then select the AI agent's name in the External Conversation Bot field.

Other Salesforce Products and Services

This release is in preview

Note: This release is in preview. Features described in this document don't become generally available until the latest general availability date that Salesforce announces for this release. Before then, and where features are noted as beta, pilot, or developer preview, we can't guarantee general availability within any particular time frame or at all. Get the latest information on these new features.

Customer Success Group

Salesforce Success Plans provide access to innovative tools, guidance, and support at every step of your journey. From building expertise and driving product adoption, to troubleshooting and maintaining technical health, we help you fast-track your success. With each release, we introduce new and better ways to help you see results from all your Salesforce products. Highlights for Spring '26 include:

Customer Success Score Enhancements

- **Technical Health expansion:** Boost your system's Technical Health with enhanced security insights. Our new 'Security' subcategory provides deeper visibility into technical performance, helping you identify vulnerabilities and optimize system reliability
- **Additional signals:** Gain a comprehensive understanding with enhanced product adoption visibility. Get a more holistic view of your product adoption through additional signals to provide a more complete view of your adoption and usage metrics.

Get to know Success Plans by visiting our [overview page](#) or taking the [Salesforce Success Plans Trailhead](#)

[module](#). Use your Success Plan on the new [My Success Plan page](#) on Salesforce Help. To learn more about how to get the most out of Salesforce, check out our [Salesforce Customer Success overview page](#).

Heroku

Heroku is a cloud-based application platform for building and deploying web apps.

For information on new features, go to the [Heroku Changelog](#).

IdeaExchange

Share ideas with the Trailblazer community and Salesforce product managers with the IdeaExchange. It features a search experience that aids discoverability, more informative idea records, and search-as-you-type dupe detection to help avoid posting the same idea twice. For more information, visit the [IdeaExchange](#).

Legal Documentation
